PREFACE

This publication is the ninth in the series of annual statistical publications issued by the Central Statistical Office (CSO) .

The purpose of the publication is to provide a summary of the more important statistics in Bhutan. Statistics have been presented under a number of subject headings corresponding to the major areas of statistical interest. For each subject, a short introductory text has been given providing a brief description of the statistics, how they were obtained and any existing shortcomings. Some of the more interesting features of the statistics have also been highlighted. a thit that hat the end porth-

Much of the existing statistics in Bhutan are not yet considered to be fully reliable. In preparing the publication, attempts have been made to assess the quality of each data source and where appropriate, tables have been footnoted to highlight any shortcomings in the data. In cases where it is considered the publication might mislead, data have been omitted altogether leaving some apparent gaps in the statistical presentation.

Every effort has been made to ensure that the statistics given in the publication meet with acceptable statistical standards. However, it has been necessary to place reliance on existing data collections and it was not always possible to undertake as detailed an assessment of data sources as would have been preferred. This was due to the wide range of data sources used and because detailed background information on many data collections was not always available. Consequently, some shortcomings in the data presented are inevitable, though it is considered that these have been kept to a minimum. Throughout the compilation of the publication, the CSO has maintained close contact with all sectors.

The Central Statistical Office has embarked on a program to upgrade the statistical service in Bhutan. Over the next few years, a number of new statistical collections will be introduced to fill existing statistical gaps. At the same time, existing statistical systems will be reviewed and improvements made as necessary. As a result, the range and quality of statistics available in Bhutan should improve over the next few years, and this will be reflected in further upgradings of this publication in the future.

GENERAL DESCRIPTION OF BHUTAN

Position and area - Bhutan comprises a land area of 46,500 square kilometers. The land lies between latitudes 26 45'N and 28 10'N and between longitudes 88 45'E and 92 10'E. The country is relatively compact with a maximum latitudinal distance of 170 kilometers and the maximum longitudinal distance of 300 kilometres.

Bhutan is landlocked. It is bordered by India in the south, and by the Tibetan Autonomous Region of China in the north and northwest.

Bhutan's borders are largely natural ones. The border with Tibet is traditional following the watershed of the Chumbi Valley in the north-west and the crest of the Himalayas in the north. The southern border with India was established by treaty with the British in the nineteenth century and basically follows the line made by the Himalayan foothills with the plains.

Landforms - Bhutan is almost entirely mountainous with flat land limited to the broader river valleys. The land rises from approximately 300 metres above sea level in the south to the towering Himalayan mountains in the north of over 7,000 metres high. The densely populated central valleys are separated from the south by a 2,000 metre high chain of mountains.

Bhutan has three major landform features: the southern foothills, the inner Himalayas and the higher Himalayas. The southern foothills rise from the plains to heights of about 1,500 metres extending to the north by about 20 kilometres. Southern Bhutan consists of a heavy network of steep hills covered with large tracts of dense forest and jungles.

Central Bhutan consisting of the inner Himalayas rises gradually to about 3,000 metres. This region contains the broader river valleys - Paro, Thimphu, Punakha, Wangdiphodrang, Bumthang and Tashigang which comprise the economic and cultural heartland of the country. An infinite variety of plants, flowers and trees including apples, peaches and plums grow in the fertile valleys. Rice is the principal crop and large tracts of forest including birch, pine, chestnut and oak cover Central Bhutan.

The northern region comprises the main Himalayan range of high snow-capped mountains which separate Bhutan from Tibet. The Kula Gangri and the Gangkar Punsum (both over 7,500 metres) and the Jomolhari (7316 metres) are the highest peaks in the Bhutan Himalaya. The slopes of the mountains are covered with birch, magnolia and rhododendron while for many months of the year the summits are decked with snow. Population in this zone is sparse.

<u>Rivers</u> - All but two of Bhutan's rivers rise in the higher Himalayas and journey south to join the Brahmaputra in India.

Almost all the valleys have a swiftly flowing rivers or streams which merge ultimately into four major river systems as they flow south - the Ammochu, the Wongchu, the Sankosh and the Manas. The flows of the rivers are fed by the perennial snows or the summer monsoons and are highest in the monsoon months (June to September) and lowest in winter (December to March).

<u>Climate</u> - The country can be divided into three district climatic zones corresponding broadly to the three main geographical divisions. The southern belt has a hot humid climate with temperatures remaining fairly even throughout the year between 15 C and 30 C with rainfall ranging between 2,500 mm to 5,000 mm in some areas.

The central inner Himalayas has a cool temperate climate with annual rainfall averaging about 1,000 mm with the western region receiving comparatively higher rainfall.

The higher and more northern region has a severe alpine climate with annual rainfall around 400 mm. Much of the rainfall is concentrated in the summer months with the south west monsoon accounting for 60-90 per cent of the total rainfall.

There is substantial variation within these broad ranges and the climate and rainfall characteristics change dramatically from one valley to an adjacent one with consequent sharp changes in the composition of agricultural production.

whereas shows was lawal an the south to the

Widespread flood rainfall may occur during the summer monsoons and the waters of the valley rivers may swell dramatically, spreading across the plains and flooding fields, bridges and houses.

GOVERNMENT

The Monarchy - On December 17 1907, Ugyen Wangchuck was crowned the first hereditary monarch of Bhutan by the civil and monastic representatives.

It was as a result of the influence of the strength and farsightedness of Ugyen Wangchuck that for the first time Bhutan was united under a central authority which provided the country with stability and the opportunity for development. In 1926 Ugyen Wangchuck was succeeded by his son Jigme Wangchuck, who ruled until his death in 1952.

The third Druk Gyalpo, Jigme Dorji Wangchuck began a campaign of modernisation and expansion of Bhutan's Government and society based on the accomplishments of his two predecessors in uniting the country under a strong central authority. Hence, the National Assembly consisting of

Macional Asse	Emply consisti	ng or representa	tives of	the people.
the monastic in 1953.	order and ci	vil administrati	on was	re-established

In 1984, life expectancy was estimated at 45.8 years for males and 49.1 years for females. The expected number of live births for each woman during her lifetime was estimated at 5.9. There were an estimated 142 deaths of children in their first year per thousand live births.

The main source of statistics on population is the Population Cansue. Population Gensusss are undertaken in most dountries on a five or tan yearly basis and aim to provide a full such as demography health, education and other social aspects. Gensuses are deful not only because they provide a range of current population data but also for use as a beachmark for baking population sctimates in non-Census years and for population stories.

The present Druk Gyalpo, His Majesty King Jigme Singye Wangchuck acceded to the throne in 1972 on the demise of his father. His Majesty the King is the Head of State and also the Head of Government. He is assisted by the Cabinet which consists of His Majesty's Representatives in various Ministries, Ministers and some senior civil servants.

The National Assembly - The National Assembly has 150 members of which 100 members represent the people. These are elected for a three year term by consensus in each of the Dzongkhags. Ten monastic representatives are elected by the regional monk bodies while forty representatives of the Government are nominated by the King. They include members of the Council of Ministers and the Royal Advisory Council, Secretaries of various Government Departments and several Dzongkhag officers.

The National Assembly meets twice a year. The Assembly enacts legislation and advises the Government on all matters of national importance. Decisions are passed by a simple majority. A secret ballot is taken on all matters of national importance. Any Bhutanese over 25 years of age can be a candidate for membership.

The Royal Advisory Council - The Royal Advisory Council was formally established in 1965 to advise the King and Government Ministers and to supervise the implementation of programs and policies laid down by the National Assembly. It consists of 10 members. There are two members elected by the National Assembly and two members appointed by the King. The Chairman is nominated by the King from among the members.

The Monk Body - The Monk Body which currently has a strength of about 5,000 is financed by an annual subsidy from the Government and is the sole arbiter on religious matters. The Je Khempo is the Head of the Body chosen from among high ranking gelongs (monks). He is assisted by four high ranking "Lopens" of the Central Monk Body which consists of 1,000 gelongs.

Local Government - Local administration has been strengthened to meet the requirements of decentralised administration and development. There are 4 Zones and 18 Dzongkhags or Districts each under the charge of a Zonal Administrator and Dzongda responsible for civil administration and development activities. Basically. a Zone comprised of three to four Dzongkhags based upon their homogenity and topographical structure. Each Dzongda is assisted by a Dzongda Wongmo or a Dzongrab who are responsible for planning and development and civil administration. The larger Dzongkhags are sub-divided into subdivisions (Dungkhags) headed by a Dungpa. Groups of villages have a headman - the Gup (in the north) or Mandal (in the south). In each Dzongkhag, the Dzongda is assisted in his development functions by the Dzongkhag Yargye Thschokchung (or District Development Committee) which consists of people's representatives and officials. Tate in Bhutan was estimated in 1984 at 13.1

The Judiciary - Bhutan's legal code is based on that laid down by Ngawang Namgyal, the first Shabdung who arrived in Bhutan in 1616. Traditional Buddhist precepts are significantly maintained in the legal processes.

The High Court consists of six judges. Four of the judges are appointed by the King and two public representatives elected by the National Assembly subject to ratification by the King. There are courts in each Dzongkhag headed by a Thrimpon and assisted by Ramjams but minor disputes are settled by village gups.

Flaus of the Filmer at the

ane senior civil sorvells.

In 1984, life expectancy was estimated at 45.8 years for males and 49.1 years for MolTAJU909.1 expected number of live births for each woman during her lifetime was estimated at 5.9. There were an estimated 142 deaths of children in NOITJUDOTNI year per thousand live births.

The main source of statistics on population is the Population Census. Population Censuses are undertaken in most countries on a five or ten yearly basis and aim to provide a full count of the population according to a range of characteristics such as demography, health, education and other social aspects. Censuses are useful not only because they provide a range of current population data but also for use as a benchmark for making population estimates in non-Census years and for population projections. Population Censuses were undertaken in Bhutan in 1969 and 1980.

The second major element of population statistics relates to the demographic characteristics of the population. The most common source of information on demography is the vitals registration system (which usually covers the registration of births and deaths and sometimes marriages and divorces). In Bhutan, the vitals registration system does not currently provide full coverage of births and deaths, and it has been necessary to undertake a special sample survey (in 1984) to obtain the important demographic information.

The last she was seen and being structure one was set

Statistics presented in this Chapter include estimates of current and future population together with data from the 1984 Demographic Sample Survey. The interpretation of the major demographic indicators is as follows:

Crude birth rate: number of live births in a year per thousand population. 85 P02.02 General fertility rate: number of live births in a year per thousand women aged 15 to 49. Total fertility rate: average number of children born by women during their lifetime. Gross reproduction rate: average number of daughters born 83-28 by women during their lifetime. Net reproduction rate: reproduction rate adjusted for mortality of women. Crude death rate: number of deaths in a year per thousand population. Infant mortality rate: number of deaths during first year of life per thousand live births. Rate of natural increase: the difference between the crude birth rate and the crude death rate.

MAIN FEATURES

In 1990, the total population of Bhutan was estimated to be 1,461,853 of which 739,833 were males and 772,020 were females.

The birth rate in Bhutan was estimated in 1984 at 39.1 births per thousand population. The death rate at the same time was estimated at 19.3 deaths per thousand population. This represents an annual population growth rate of approximately 2 per cent. If this rate of population increase is sustained, the population of Bhutan will double in the next 35 years.

Child dependency	47 7	67.4
Old age dependency	7.5	6.8
Total dependency	74.8	74.2
Index of aging (b)	11.2	10.1

(a) Dependency ratio measures the number of dependents as a percentage of the population aged 15 to 64. Child dependency refers to children aged 0-14, while old age dependency refers to persons aged 65 and over. (b)Index of aging refers to the number of persons aged 65 and over as a percentage of the number of persons aged 0 to 14.

children were vaccinated for BCG, HTIABH Stainst measies, about 21,000 against dipittier is and 22,000 against pollomyelities. The numbers were substantially higher than the previous MOITDUGORTHI

General health conditions in Bhutan are affected by low nutrition intake, poor sanitation, and a high prevalence of parasitic infections and contagious diseases. Efforts to establish modern medical facilities in Bhutan were begun in 1962. Institutional health facilities, until quite recently were concentrated in the urban centres, but today the emphasis has shifted to the rural areas where the majority of the population live. Basic health units (BHU's) usually serving remote to districts, staffed by well-trained para-medical personnel are equipped to treat minor ailments and advise on preventive measures to avoid the spread of communicable diseases. These BHU's are supported by dispensaries. had 353 patients including

There are also a number of special health programs in Bhutan administered by the Department of Health. These cover immunization, maternal and child health services, malaria eradication, leprosy and family planning.

The main indicators of the health status of the population are morbidity and mortality. Morbidity refers to the types of illnesses people suffer from, while mortality relates to death rates and causes of death. Morbidity and mortality data are usually obtained from administrative sources. Morbidity data can often be obtained from patient records of health units, while information on mortality rates and causes of death is usually obtained from vitals registration systems (ie the system of civil losarital bods registration of births and deaths).

In Bhutan, some morbidity statistics are available based on patients treated by hospitals, basic health units and dispensaries. Little information on mortality is available. While a registration system is in place for the reporting of births and deaths, it is recognized that there is some undercoverage and problems with the identification of cause of death. Overall levels of mortality have been estimated from the Demographic Sample Surveys, but cause of death data have not yet become available. Efforts are under way to improve the vitals registration system.

TABLE 2.2 : HEALTH RERSONNED BY CATEGORY, 1986 TO 1989

Doctors (a)

MAIN FEATURES

In 1989, there were 26 hospitals, 69 basic health units and 46 dispensaries scattered across Bhutan. A total of 157 doctors and 671 paramedical workers service the health needs of the population. This represents one doctor for every 9,100 population. There were 944 hospital beds available in 1989, representing one bed per 1,500 population. 2103300

Information on diseases of patients treated in basic health units and dispensaries, as summarized in Tables 2.3 and 2.4 provides a guide to the health problems of the people. The major diseases are respiratory problems (19.3 per cent of patients treated in 1989) and diarrhoea/dysentery (15.3 per cent). Worms, skin infection and malaria were also widespread.

children were vaccinated for BCG, 21,000 against measles, about 21,000 against diphtheria and 22,000 against poliomyelitis. Th numbers were substantially higher than the previous year. don't

Maternal and child health services are an important part of the health services. In 1989, total attendance at materna health clinics was over 69,000 and child health services was ove 187,000. Yitheber eting Lithe Restricted follow fondigutitani

concentrated in the united centres, but today the emphasis has Malaria is still an endemic disease in Southern Bhutan with over 176,000 people living in malaria areas. Blood examination carried out as part of the malaria eradication program produced over 19,000 positive readings during 1989. Leprosy is also a problem in some areas and at the end of 1989, leprosy hospitals had 353 patients including 57 new cases detected during the

TABLE 2.5 : PATHERTS ING

(a)Refers to total attendance, not a count of individuals. (b) Home deliveries are those attended by health staff. Many women attending health units for antenatal care have deliveries at home without attendence by health staff and are not included in the delivery figures. (c) Children attending health units are classified according to three degree of malnourishment. Third degree malnourishment refers to the most severe cases.

INTRODUCTION

The development of a comprehensive education system in Bhutan was initiated in 1961. Prior to that time there were virtually no modern education facilities inside Bhutan, apart from the traditional education given in the monasteries.

Chi chine and

Today there is an extensive network of schools and other educational institutions spread throughout the country. Many schools contain boarding facilities for students living in areas far from the nearest school. While the medium of instruction in schools is English, Bhutan's national language Dzongkha, is taught as a compulsory subject from primary to college level. School curricula also include religious, instruction, training in traditional arts and crafts and agriculture.

The Department of Education maintains an extensive range of data on students, schools, and teaching personnel. Some summary data are presented in this Chapter.

MAIN FEATURES

0-12501

17.7

In 1990, there were altogether 233 schools scattered through out the country of which 46 were extended classrooms, 156 primary schools, 21 junior high schools and 10 were high schools. Besides these, there is a college and several other technical and vocational institutions, in addition to monastic schools and Sanskrit Patshalas. faile then control bereals?

In 1990 the total number of students enrolled in schools in Bhutan was 68,000. Of these, 52,000 were enrolled in primary schools, 11,500 in junior high schools and 4,500 in high schools. There were 26,300 females enrolled in schools (or about 39 per cent of total enrollment).

Student numbers in schools have increased over the past few years from 36,700 in 1981 to 68,000 in 1990.

There were altogether 2,419 school teachers in 1990, of which 1,757 were in primary schools, 423 in junior high schools and 239 in high schools. SET SHID DORE HOTTO THE ALGE OF SOLLAT SOLLAT

4. HUMAN RESOURCES

INTRODUCTION

The economy of Bhutan is characterized by the predominance of people engaged in self-employment, particularly those working their own land. There is also a good deal of small cottage industry often undertaken in the home. The number of persons working for wages is relatively small.

Statistics on human resources are designed to measure the involvement of people in economic activity. Economic activity refers to the production of economic goods and services and includes persons who are self-employed (e.g. farmers operating their own land) as well as persons who work for wages (ie. 2.3 9.8 10001

Broadly, a statistical system for human resources (or labour) should cover topics such as size and characteristics of the labour force, employment, wage rates and conditions of work. Labour statistics may be obtained from three main sources:

3.3

5,02

a) Household Surveys, whereby information is obtained from the individual about his or her employment, earnings and other aspects of their working activities.

b) Employer Surveys, whereby information on number of persons employed and wage levels is obtained from employers.

c) Administrative sources, whereby various aspects of labour statistics are obtained from administrative sources (e.g. civil service employee data obtained from civil service records). In Bhutan, there are currently few statistics available on human resources and labour. The only data available are some broad level data on economic activity which was obtained from two

household surveys, and some data on civil service employment were obtained from administrative records.

MAIN FEATURES

100.001

2 to Food Componistion of

D. R. PHER & LAW SPE

In 1984, over 93 per cent of the population aged 15 to 64 were engaged in some economic activity, including 90 per cent of the males and over 96 per cent of the females. For males, 78 per cent were engaged in agriculture and 12 per cent in other activities, while for females over 95 per cent were engaged in agriculture and only one per cent in other activities. 42 - 24

As of July 1990, total civil service employment amounted to 12,100. Of these, 1,191 (or 10 per cent) were females. There has been a substantial reduction in the number of civil service employees since January 1987 as a result of the government's

5. LAND USE AND AGRICULTURE

INTRODUCTION

Bhutan is predominantly an agricultural country wi agriculture being the main subsistence occupation of the majori of Bhutanese people. For this reason, programs to increase a improve both the quantity and quality of agricultural product and for the country to achieve self-sufficiency in food grai and to have a marketable surpluses for sale, are of paramou importance in government planning.

Animal husbandry also plays an integral part in the farmi system in Bhutan. Farmers keep cattle for draught and milki purposes, in addition to a few chickens and some pigs f slaughter. At higher altitudes, herds of yak and sheep are ke on pasture.

Efforts are under way to improve the statistical system f agriculture. During 1988 and 1989, the CSO in conjunction wi with the Department of Agriculture undertook a detailed samp survey to collect information on crop areas and livesto inventories in all Dzongkhags. Some data from this surve (together with data from a pilot Agriculture Census undertaken Wangdiphodrang in 1987) are presented in this chapter. Data fro

MAIN FEATURES

Bhutan covers a surface area of about 46,500 squar kilometres. About 71 per cent of the country's total surface area consists of forest, 9 per cent is potentially able to buy used for cultivation and the rest is wilderness.

During the year 1989/90, irrigation schemes were extended to cover newly constructed areas of 724 hectares and renovated areas of 2,162 hectares.

According to recent Agronomic Surveys undertaken by th CSO, there are an estimated 64,770 agricultural holders i Bhutan. The majority of the holders have less than 5 hectare of land, an estimated 27 per cent of holders have less than on hectare, while a further 30 per cent have between one and tw hectares. Only 10 per cent have five hectares or more.

The main cereal crops grown are paddy, maize, wheat mustard, barley, buckwheat and millet. The CSO Agronomic Surve and mustard was 26,000, 6,400, 41,900 and 4,100 hectares res pectively. Similarly, the production of paddy ,wheat, maize an mustard were estimated to be 43,100, 4,100, 31,100, and 1,30 tonnes respectively. Other cash crops include potatoes, apples chilies, ginger, oranges and cardamom.

The most important livestock in Bhutan are cattle, yaks sheep, poultry and pigs. In 1989, there were about 303,500 cattle, 37,000 yaks, 47,800 sheep, 210,700 poultry and 63,200 pigs.

6. INDUSTRIES

INTRODUCTION

257-X 1000 (0.100)

The subject 'industries' covers the whole range of industrial activity carried out by businesses in all fields including mining, manufacturing, wholesale and retail trade, and other service industries. In Bhutan, the industrial sector has until recently, played a relatively small role in the economy of the Kingdom.

The mining industry in Bhutan is as yet relatively undeveloped. The Kingdom has significant deposits of a number of mineral resources, including limestone, coal, graphite, gypsum, slate and dolomite. Most mining activity is limited to relatively small operations, mainly involved in the mining of limestone, coal, slate and dolomite.

The manufacturing industry is dominated by a small number of major operators such as the Penden Cement Plant and the Gedu Wood Manufacturing Corporation. The first chemical plant - Bhutan Carbide and Chemicals Ltd. - was inaugurated during 1988. In addition, there are a number of smaller manufacturing plants concentrated in the food processing and wood products sectors. Cottage industries also play a prominent role. With its good timber resources and favourable agricultural conditions, there is ample scope for expansion of the manufacturing sector especially in these areas.

As the industrial sector grows in Bhutan, statistics on industry will become increasingly important. The CSO will be giving special attention to the development of statistical systems to meet the important needs for industrial statistics in the future.

MAIN FEATURES

Mood and Paper Products Chemical Products Minoral Products

Lange Lange

eloubort Inclues.

There were 349 manufacturing and mining firms licensed in 1986, of which 14 were public-owned and 335 were in private ownership. A total of 249 firms were in the food industry, the majority of which were very small operations. The other important industry was wood and paper products with 55 licensed firms, over half of which employed more than 10 persons.

In the manufacturing sector as a whole, 285 firms employed less than 10 employees, 21 had employment within the range 10-19, 16 employed between 20-49 employees, while 18 had more than 50 employees.

7. TRANSPORT AND COMMUNICATION

INTRODUCTION

Traditionally the principal means of transport in Bhutan h been foot paths and mule tracks and these will continue to pl an important role into the future. The development of the mot road network was initiated in 1961 with the commencement of wo on the construction of the first road from Phuntsholing to Pa and Thimphu. The importance of road transport has grown with t expansion of the road network, and there are now extensive b services between most centres in the Kingdom. Civil aviati arrived in Bhutan with the establishment of Druk Air Corporati and its commencement of operations in 1983 on the Paro - Calcut sector. Services were extended to cover the Paro - Dhaka sect in 1986; Paro - Delhi in 1988; and Paro - Bangkok and Paro Kathmandu in 1989.

Postal and other communication facilities were limited prito 1962. Since that time an extensive postal service has be developed so that the majority of the population now h reasonable access to mail services. Telephone services have all been considerably expanded and telex exchanges installed Thimphu and Phuntsholing. An extensive civil wireless syst also exists servicing many remote centres.

MAIN FEATURES

By June 1990, there were 2,336 kilometers of motorable ro in Bhutan, of which 1,453 kilometers were black topped. As September 1989, there were a total of 7,664 registered vehicl in Bhutan.

Bus transport combines both public and private enterpris Government buses carried 1.2 million passengers in 1988/89 total of 12,732 passengers were carried by Druk Air dur 1989/90, an increase of nearly 16 per cent compared with 1986/

Post offices in Bhutan handled a total of 3.0 million it of mail during 1989 of which 2.2 million were domestic 0.8 million were overseas. TABLE 7.1 : ROAD NETWORK IN BHUTAN BY TYPE, JUNE 1990

INTRODUCTION

9. TOURISM REVENCES, 1984 to 1989

The tourism industry has been an important source of hard currency to Bhutan since the country was first opened to tourists in 1974. The potential as far as foreign exchange earnings are concerned is very high, though a strategy of regulating the number of tourists coming into Bhutan has been followed by the

The main statistics of interest in the field of tourism relate to the characteristics of visitors and the details of existing tourist facilities. Interest centres on visitor arrivals, where they come from, when they come and the purpose of their visit. Earnings of foreign exchange from overseas visitors is another important aspect. MAIN FEATURES

The total number of tourist arrivals in 1989 was 1,480, which is about 33 per cent less than the previous year. The highest number of tourists recorded was 2,524 in the year 1987. The largest numbers of tourists came from Europe, United States, and Japan. The majority of tourists (83 per cent) came on a tour, while, 17 per cent came for trekking and mountaineering. The arrivals in the months of March, September and October accounted for well over half of all arrivals.

10. BALANCE OF PAYMENTS

Bhutan's economy is closely linked with India, though efforts towards diversification of products and markets are actively pursued.

While economic links with other countries are limited, significant amounts of aid have been received in recent years and this has enabled substantial increases in imports from third countries. Exports to third countries continue to be very low and reliance is placed on inflows of aid for the financing of imports.

Balance of payments statistics are designed to show the difference between the total payments made to foreign countries and the total receipts from foreign countries. Payments and receipts include imports and exports of merchandise; services and transfers (such as freight and insurance charges); expenditure by travelers; and capital movements (such as loans and investments). The balance between imports and exports is measured by the trade balance. A more comprehensive picture of the balance of payments situation is obtained by including services and transfers to provide a measure of the current account balance.

The balance of payments statements also show how any negative current account balance is financed - in the case of Bhutan this is achieved through foreign aid. Any surplus of foreign aid over and above current account deficits means an increase in the foreign currency reserves of the country.

Balance of payments statistics in Bhutan are compiled by the Royal Monetary Authority based on information from its own accounts and those of the Bank of Bhutan, together with information on imports and exports. Efforts are under way to improve the data in a number of areas.

MAIN FEATURES

During the period from 1982/83 to 1986/87, the trade balance deficit rose from Nu. 487.1 million to Nu. 778.1 million. In 1987/88, the deficit declined to Nu. 412.3 million with the result of the growth in exports of electricity from the Chhukha project to India. Imports grew sharply over the period 1982/83 to 1987/88 from Nu. 646.5 million to Nu. 1,124.2 million. Imports from countries other than India accounted for a significant part of this growth, rising from Nu. 100.0 million in 1982/83 to Nu. 224.5 million in 1987/88.

Foreign aid payments increased from Nu. 788.7 million in 1982/83 to Nu. 1,046.6 million in 1987/88. Aid from India accounted for Nu. 652.7 million of the 1987/88 figure. Total aid inflow has generally been larger than current account deficits and therefore Bhutan's total international reserves have been increasing over time. In 1988/89, Indian rupee reserves amounted to Rupees 776.9 million (an increase of Rupees 87.9 million over the previous year), while convertible currency reserves amounted to \$US 50.1 million (an increase of \$US 9.9 million over the previous year).

(a) Refere to 1 April 1987 to 30 June 1938, While previous yours refer to 1 April to 1 House a light of a light of the second of

In 1988, the chief exports to India were cement (Nu. 110 million), electricity (Nu. 337.3 million) and a range of timb and food products (especially cardamom, fruit products, potato and oranges). At the same time, an estimated Nu. 68.6 million rice was imported from India, together with Nu. 49.1 million diesel oil and a variety of transport and machinery equipme (tyres and tubes, truck chassis, machinery parts).

L Concerce alide The value of the Ngultrum is pegged to the Indian rupee a one - to - one parity. In relation to the US dollar, there h been a continuous depreciation of the Ngultrum over the past f years, declining from a calendar year average of Nu. 8.66 to the dollar in 1981 to Nu. 17.32 to the dollar in May 1990. Balance of payments structure are decomed to show the

11. MONEY, BANKING AND EINANCE pointed ded million at the end of 1988s a The was of these at anose has INTRODUCTION fine with the building and constitution with NOTTOUTION 1988 receiving 40 per centrof all advances compared all's Until recent times, most economic transactions in Bhutan were carried out on the basis of barter arrangements. The widespread use of money commenced during the 1960's with the expansion of trade with India and the inflow of development assistance. The Indian rupee was most commonly used until 1974 when the government first issued Ngultrum notes, Bhutan's official currency. The monetary sector has grown since then with increasing economic development, improvement in transport and communication facilities and greater urbanization, though the barter economy continues to be important.

The monetary sector in Bhutan comprises the Royal Monetary Authority, Bhutan's Central Banking organisation; and the Bank of Bhutan, the country's only commercial bank. The non-bank financial institutions are the Royal Insurance Corporation of Bhutan and the Unit Trust of Bhutan. In addition, a new non-bank financial institution, the Bhutan Development Finance Corporation was established during 1988 to provide long term loans for development purposes.

A statistical system for the money, banking and finance

sector has been developed by the Royal Monetary Authority. The main element of the system is the monetary survey, which is a consolidation of the accounts of the Royal Monetary Authority and the Bank of Bhutan showing the financial relationships between the two institutions and other sectors of the economy. Items covered include foreign assets and domestic credit, together with information on the money supply. In addition, financial statements are also available for the two non-bank financial institutions.

Soreign assets (net) 5,15 - 545,7 1 190,2 1599,4 700,1 1,077,0 1,304,4 1,465,5 MAIN FEATURES 0000010 01000 0100 1.001 1.001 1.000 1.1 0.000 5.1 0.000 5.

During 1989, there was an increase in the broad money supply (M2) of Nu. 252.9 million or 35 per cent from the previous year. This was largely accounted for by an increase in net foreign assets of Nu. 61.8 million. 0.32 0.457 (50) ynon brode yfilitpli hoar Koney supply-Warrow mohey (W1)

From December 1983 to December 1989, there was an increase in net foreign assets of the Royal Monetary Authority and the Bank of Bhutan of Nu. 1,100.5 million. Domestic credit decreased by Nu. 107.0 million over the same period, mainly as and consequence of large increases in deposits of government with the Bank of Bhutan. (b) Revised data, axcluding indexts in circulation

Investment in the two non-bank financial institutions has grown rapidly over the past few years. Between December 1983 and December 1989, total investment in the Royal Insurance

Corporation of B	hutan increa	sed from	Nu. 1	.37.5 m	illion to
Nu. 607.7 million increased from Nu.	while invest 25.2 million	ment in t to Nu. 2	he Unit 97.0 mil	Trust lion.	of Bhutan
		71			

/1

Loan amounts outstanding by the financial sector (incluboth banking and non-banking institutions) totalled Nu. million at the end of 1988. The use of those advances changed over time with the building and construction industry 1988 receiving 40 per cent of all advances compared with 27 per cent in 1983. Agriculture received 4 per cent of advances

in 1988, industry received 20 per cent and trade and com received 13 per cent.

Interest rates on deposits with the Bank of Bhutan from 5 per cent to 11 per cent. The Bank's interest rate advances vary from 10 per cent to 15 per cent.

destion facilities is the test of the least stick the the test on, though the

The monetary dector in Shutan comprises the Royal Monetary rity, Bhuttan's Control Bauling creatisation; and the Sanktor a the Country's only connerciel banks "The "nonebank tal, institutions are he Sovel Insurance Colporation" of a and the Unit True of Ehucan. In addition, a new "horebank suil institution, the Jhutan Development Finance Colporation stabilshed during 1988 to provide long term loans for upment purposes.

15. PRICES

INTRODUCTION

The only price statistics currently compiled in Bhutan relate to the Consumer Price Indexes, often referred to as the CPI. The CPI has been produced by the CSO twice a year since December 1979. In addition, a food price index for Thimphu has been produced each quarter since September 1987.

The purpose of the CPI is to provide a general indicator of the rate of price change for consumer goods and services. The CPI is important in monitoring overall price development and assessing changes in the living standards of the population.

The CPI is formed by measuring the change in the cost of purchasing a `basket' of consumer goods and services, where items in the `basket' are weighted according to their relative importance in the total spending of consumers. The `basket' includes food items (e.g. rice, other cereals, vegetables, oils and fats, and spices) together with non-food items such as clothing, fuel, furniture and other personal items. Items such as cereals are weighted more heavily than say furniture, because they represent a larger proportion of consumer expenditure. A price change in cereals will therefore have a greater effect on the CPI than a price change for furniture.

The CPI is presented as index numbers, where the indexes are measured relative to the base of June 1979 = 100.0. Price change is estimated by measuring change in the index numbers.

MAIN FEATURES

In June 1990, the rate of inflation in Bhutan as measured by the change in the Consumer Price Index over the previous twelve months was estimated to be 10.9 per cent. This means that prices for consumer items in Bhutan as a whole rose by an average of 10.9 per cent over this twelve month period. This compares with a rate of 9.1 per cent recorded in the twelve months to June 1989.

Prices for food rose by an average of 8.2 per cent in the twelve months to June 1990, while prices for non-food items rose by 16.6 per cent over the same period.
