## METRIC EQUIVALENTS

1 kilometre	= 0.62 miles
1 hectare	= 2.47 acres
1 square kilometre	= 0.386 square miles
1 litre	= 0.220 imperial gallons
1 kilogram	= 2.20 pounds
1 metric tonne	= 0.984 imperial tons

## EXPLANATORY NOTES

1. In some cases, minor discrepancies may occur between sums of component items and totals because of rounding.
2. Dzongkhags given in some tables differ from those given in Annex I. This is because of recent changes in the Dzongkhags following the creation of Punakha and Chhukha Dzongkhags and the abolition of Gasa Dzongkhag.

## PREFACE

This publication is the tenth in the series of annual statistical publications issued by the Central Statistical Office (CSO).

The purpose of the publication is to provide a summary of the more important statistics in Bhutan. Statistics have been presented under a number of subject headings corresponding to the major areas of statistical interest. For each subject, a short introductory text has been given providing a brief description of the statistics, how they were obtained and any existing shortcomings. Some of the more interesting features of the statistics have also been highlighted.

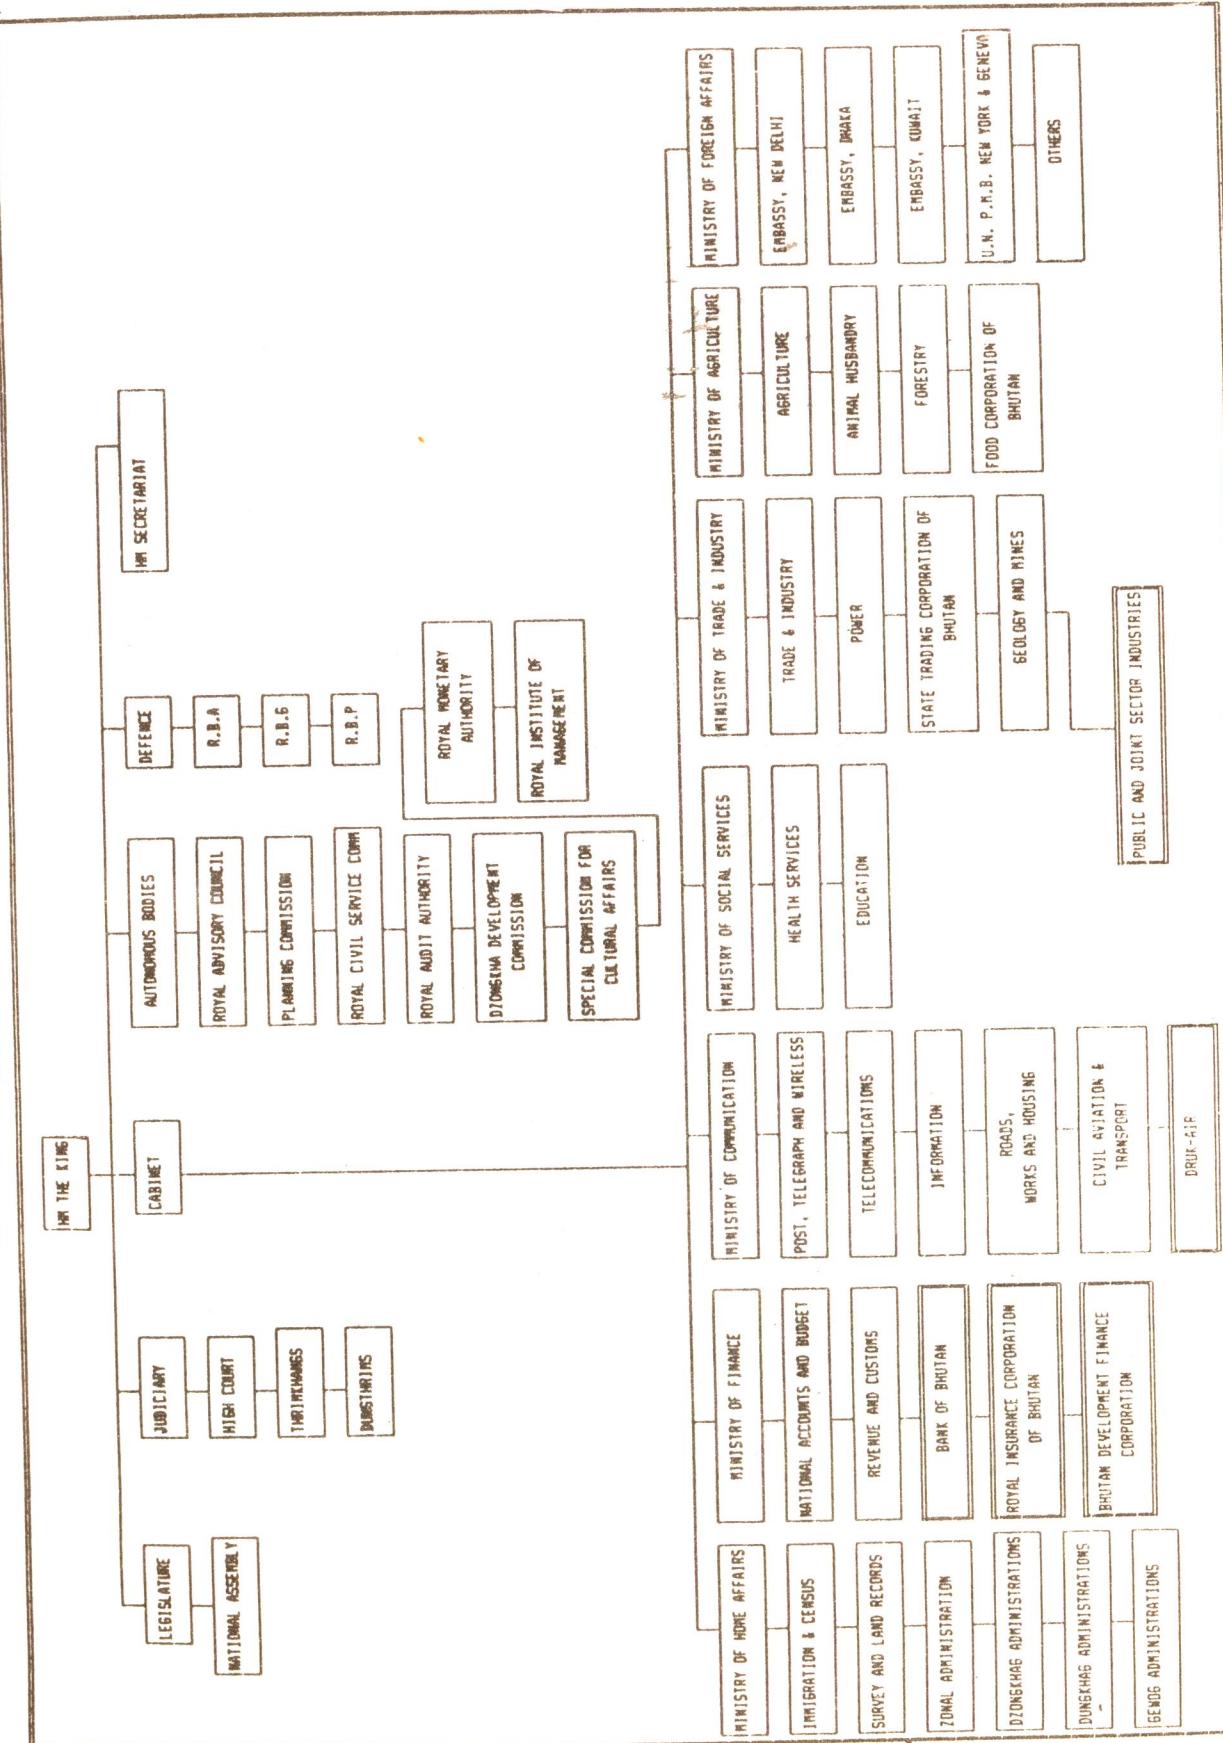

Much of the existing statistics in Bhutan are not yet considered to be fully reliable. In preparing the publication, attempts have been made to assess the quality of each data source and where appropriate, tables have been footnoted to highlight any shortcomings in the data. In cases where it is considered the publication might mislead, data have been omitted altogether leaving some apparent gaps in the statistical presentation.

Every effort has been made to ensure that the statistics given in the publication meet with acceptable statistical standards. However, it has been necessary to place reliance on existing data collections and it was not always possible to undertake as detailed an assessment of data sources as would have been preferred. This was due to the wide range of data sources used and because detailed background information on many data collections was not always available. Consequently, some shortcomings in the data presented are inevitable, though it is considered that these have been kept to a minimum. Throughout the compilation of the publication, the CSO has maintained close contact with all sectors.

The Central Statistical Office has embarked on a program to upgrade the statistical service in Bhutan. Over the next few years, a number of new statistical collections will be introduced to fill existing statistical gaps. At the same time, existing statistical systems will be reviewed and improvements made as necessary. As a result, the range and quality of statistics available in Bhutan should improve over the next few years, and this will be reflected in further upgradings of this publication in the future.

C. Dorji

**GROSS DOMESTIC PRODUCT**

Agricultural sector (1986)	% of total	22.29
Real growth (1985 to 1986)	%	12.9

**CONSUMER PRICE INDEX**

Change (Dec. 1990 to Dec. 1991)	%	13.3
Average change (1990 to 1991)	%	9.2

**INTRODUCTION**

**GENERAL DESCRIPTION OF BHUTAN**

**Position and area** - Bhutan comprises a land area of 46,500 square kilometers. The land lies between latitudes 26° 45' N and 28° 10' N and between longitudes 88° 45' E and 92° 10' E. The country is relatively compact with a maximum latitudinal distance of 170 kilometers and the maximum longitudinal distance of 300 kilometres.

Bhutan is landlocked. It is bordered by India in the south, and by the Tibetan Autonomous Region of China in the north and north-west.

Bhutan's borders are largely natural ones. The border with Tibet is traditional following the watershed of the Chumbi Valley in the north-west and the crest of the Himalayas in the north. The southern border with India was established by treaty with the British in the nineteenth century and basically follows the line made by the Himalayan foothills with the plains.

**Landforms** - Bhutan is almost entirely mountainous with flat land limited to the broader river valleys. The land rises from approximately 300 metres above sea level in the south to the towering Himalayan mountains in the north of over 7,000 metres high. The densely populated central valleys are separated from the south by a 2,000 metre high chain of mountains.

Bhutan has three major landform features: the southern foothills, the inner Himalayas and the higher Himalayas. The southern foothills rise from the plains to heights of about 1,500 metres extending to the north by about 20 kilometres. Southern Bhutan consists of a heavy network of steep hills covered with large tracts of dense forest and jungles.

Central Bhutan consisting of the inner Himalayas rises gradually to about 3,000 metres. This region contains the broader river valleys - Paro, Thimphu, Punakha, Wangdiphodrang, Bumthang and Tashigang which comprise the economic and cultural heartland of the country. An infinite variety of plants, flowers and trees including apples, peaches and plums grow in the fertile valleys. Rice is the principal crop and large tracts of forest including birch, pine, chestnut and oak cover Central Bhutan.

The northern region comprises the main Himalayan range of high snow-capped mountains which separate Bhutan from Tibet. The Kula Gangri and the Gangkar Punsum (both over 7,500 metres) and the Jomolhari (7316 metres) are the highest peaks in the Bhutan Himalaya. The slopes of the mountains are covered with birch, magnolia and rhododendron while for many months of the year the summits are decked with snow. Population in this zone is sparse.

**Rivers** - All but two of Bhutan's rivers rise in the higher Himalayas and journey south to join the Brahmaputra in India. Almost all the valleys have a swiftly flowing rivers or streams which merge ultimately into four major river systems as they flow south - the Amnochhu, the Wongchu, the Sankosh and the Manas. The flows of the rivers are fed by the perennial snows or the summer monsoons and are highest in the monsoon months (June to September) and lowest in winter (December to March).

**Climate** - The country can be divided into three distinct climatic zones corresponding broadly to the three main geographical divisions. The southern belt has a hot humid climate with temperatures remaining fairly even throughout the year between 15 C and 30 C with rainfall ranging between 2,500 mm to 5,000 mm in some areas.

The central inner Himalayas has a cool temperate climate with annual rainfall averaging about 1,000 mm with the western region receiving comparatively higher rainfall.

The higher and more northern region has a severe alpine climate with annual rainfall around 400 mm. Much of the rainfall is concentrated in the summer months with the south west monsoon accounting for 60-90 per cent of the total rainfall.

There is substantial variation within these broad ranges and the climate and rainfall characteristics change dramatically from one valley to an adjacent one with consequent sharp changes in the composition of agricultural production.

Widespread flood rainfall may occur during the summer monsoons and the waters of the valley rivers may swell dramatically, spreading across the plains and flooding fields, bridges and houses.

#### GOVERNMENT

**The Monarchy** - On December 17 1907, Ugyen Wangchuck was crowned the first hereditary monarch of Bhutan by the civil and monastic representatives.

It was as a result of the influence of the strength and farsightedness of Ugyen Wangchuck that for the first time Bhutan was united under a central authority which provided the country with stability and the opportunity for development. In 1926 Ugyen Wangchuck was succeeded by his son Jigme Wangchuck, who ruled until his death in 1952.

The third Druk Gyalpo, Jigme Dorji Wangchuck began a campaign of modernisation and expansion of Bhutan's Government and society based on the accomplishments of his two predecessors in uniting

the country under a strong central authority. Hence, the National Assembly consisting of representatives of the people, the monastic order and civil administration was re-established in 1953.

The present Druk Gyalpo, His Majesty King Jigme Singye Wangchuck acceded to the throne in 1972 on the demise of his father. His Majesty the King is the Head of State and also the Head of Government. He is assisted by the Cabinet which consists of His Majesty's Representatives in various Ministries, Ministers and some senior civil servants.

**The National Assembly** - The National Assembly has 150 members of which 100 members represent the people. These are elected for a three year term by consensus in each of the Dzongkhags. Ten monastic representatives are elected by the regional monk bodies while forty representatives of the Government are nominated by the King. They include members of the Council of Ministers and the Royal Advisory Council, Secretaries of various Government Departments and several Dzongkhag officers.

The National Assembly meets twice a year. The Assembly enacts legislation and advises the Government on all matters of national importance. Decisions are passed by a simple majority. A secret ballot is taken on all matters of national importance. Any Bhutanese over 25 years of age can be a candidate for membership.

**The Royal Advisory Council** - The Royal Advisory Council was formally established in 1965 to advise the King and Government Ministers and to supervise the implementation of programs and policies laid down by the National Assembly. It consists of 10 members. There are two members elected by the National Assembly and two members appointed by the King. The Chairman is nominated by the King from among the members.

**The Monk Body** - The Monk Body which currently has a strength of about 5,000 is financed by an annual subsidy from the Government and is the sole arbiter on religious matters. The Je Khambo is the Head of the Body chosen from among high ranking gelongs (monks). He is assisted by four high ranking "Lopens" of the Central Monk Body which consists of 1,000 gelongs.

**Local Government** - Local administration has been strengthened to meet the requirements of decentralised administration and development. There are 4 Zones and 18 Dzongkhags or Districts each under the charge of a Zonal Administrator and Dzongda responsible for civil administration and development activities. Basically, a Zone comprised of three to four Dzongkhags based upon their homogeneity and topographical structure. Each Dzongda is assisted a Dzongrab who is responsible for planning and development and civil administration. The larger Dzongkhags are subdivided into sub-divisions (Dungkhags) headed by a Dungpa. Groups of villages have a headman - the Gup (in the north) or Mandal (in

the south). In each Dzongkhag, the Dzongda is assisted in his development functions by the Dzongkhag Yargye Tschogchung (or District Development Committee) which consists of people's representatives and officials.

**The Judiciary** - Bhutan's legal code is based on that laid down by Ngawang Namgyal, the first Shabduong who arrived in Bhutan in 1616. Traditional Buddhist precepts are significantly maintained in the legal processes.

The High Court consists of six judges. Four of the judges are appointed by the King and two public representatives elected by the National Assembly subject to ratification by the King. There are courts in each Dzongkhag headed by a Thrimpon and assisted by Ramjams but minor disputes are settled by village gups.

## 1. POPULATION

### INTRODUCTION

The main source of statistics on population is the Population Census. Population Censuses are undertaken in most countries on a five or ten yearly basis and aim to provide a full count of the population according to a range of characteristics such as demography, health, education and other social aspects. Censuses are useful not only because they provide a range of current population data but also for use as a benchmark for making population estimates in non-Census years and for population projections. Population Censuses were undertaken in Bhutan in 1969 and 1980.

The second major element of population statistics relates to the demographic characteristics of the population. The most common source of information on demography is the vitals registration system (which usually covers the registration of births and deaths and sometimes marriages and divorces). In Bhutan, the vitals registration system does not currently provide full coverage of births and deaths, and it has been necessary to undertake a special sample survey (in 1984) to obtain the important demographic information.

Statistics presented in this Chapter include estimates of current and future population together with data from the 1984 Demographic Sample Survey. The interpretation of the major demographic indicators is as follows:

Crude birth rate: number of live births in a year per thousand population.

General fertility rate: number of live births in a year per thousand women aged 15 to 49.

Total fertility rate: average number of children born by women during their lifetime.

Gross reproduction rate: average number of daughters born by women during their lifetime.

Net reproduction rate: reproduction rate adjusted for mortality of women.

Crude death rate: number of deaths in a year per thousand population.

Infant mortality rate: number of deaths during first year of life per thousand live births.

Rate of natural increase: the difference between the crude birth rate and the crude death rate.

### MAIN FEATURES

In 1990, the total population of Bhutan was estimated to be 60,0000 of which 303,656 were males and 296,344 were females.

The birth rate in Bhutan was estimated in 1984 at 39.1 births per thousand population. The death rate at the same time was estimated at 19.3 deaths per thousand population. This represents an annual population growth rate of approximately 2 per cent.

In 1984, life expectancy was estimated at 45.8 years for males and 49.1 years for females. The expected number of live births for each woman during her lifetime was estimated at 5.9. There were an estimated 142 deaths of children in their first year per thousand live births.

[ The age, sex pyramid of Bhutan is constructed which has a broad base at age 0-14. The tapering is rapid at about the age of 84 years, a small percentage of the population is observed. This depicts that the population is very young. ]

TABLE 1.3 : SUMMARY OF POPULATION INDICATORS, 1980 AND 1990

Population Indicators	1980	1990
Sex Ratio (Males/Females)	104.3	102.5
Age Composition (%)		
0-14	38.5	38.7
15-64	57.2	57.4
65 and over	4.3	3.9
Total	100.0	100.0
Dependency Ratio (a)		
Child dependency	67.3	67.4
Old age dependency	7.5	6.8
Total dependency	74.8	74.2
Index of aging (b)	11.2	10.1

(a) Dependency ratio measures the number of dependents as a percentage of the population aged 15 to 64. Child dependency refers to children aged 0-14, while old age dependency refers to persons aged 65 and over. (b) Index of aging refers to the number of persons aged 65 and over as a percentage of the number of persons aged 0 to 14.

## 2. HEALTH

### INTRODUCTION

General health conditions in Bhutan are affected by low nutrition intake, poor sanitation, and a high prevalence of parasitic infections and contagious diseases. Efforts to establish modern medical facilities in Bhutan were begun in 1962. Institutional health facilities, until quite recently were concentrated in the urban centres, but today the emphasis has shifted to the rural areas where the majority of the population live. Basic health units (BHU's) usually serving remote districts, staffed by well-trained para-medical personnel are equipped to treat minor ailments and advise on preventive measures to avoid the spread of communicable diseases. These BHU's are supported by dispensaries.

There are also a number of special health programs in Bhutan administered by the Department of Health. These cover immunization, maternal and child health services, malaria eradication, leprosy and family planning.

The main indicators of the health status of the population are morbidity and mortality. Morbidity refers to the types of illnesses people suffer from, while mortality relates to death rates and causes of death. Morbidity and mortality data are usually obtained from administrative sources. Morbidity data can often be obtained from patient records of health units, while information on mortality rates and causes of death is usually obtained from vitals registration systems (ie the system of civil registration of births and deaths).

In Bhutan, some morbidity statistics are available based on patients treated by hospitals, basic health units and dispensaries. Little information on mortality is available. While a registration system is in place for the reporting of births and deaths, it is recognized that there is some undercoverage and problems with the identification of cause of death. Overall levels of mortality have been estimated from the Demographic Sample Surveys, but cause of death data have not yet become available. Efforts are under way to improve the vitals registration system.

### MAIN FEATURES

In 1990, there were 28 hospitals, 71 basic health units and 44 dispensaries scattered across Bhutan. A total of 157 doctors and 760 paramedical workers devoted to the service of the health needs of the population. This represents one doctor for every 3822 population.

Information on diseases of patients treated in basic health

units and dispensaries, as summarized in Tables 2.3 and 2.4 provides a guide to the health problems of the people. The major diseases are respiratory problems (20.0 per cent of patients treated in 1990) and diarrhoea/dysentery (15.1 per cent). Worms, skin infection and malaria were also widespread.

The immunization program has been given special priority in the administration of health services. In 1990, over 20,100 children were vaccinated for BCG, 14,000 against measles, about 37,400 against diphtheria and 37,700 against poliomyelitis. The numbers were substantially higher than the previous year.

Maternal and child health services are an important part of the health services. In 1990, total attendance at maternal health clinics was over 86,532 and child health services was over 182,442.

Malaria is still an endemic disease in Southern Bhutan. Blood examinations carried out as part of the malaria eradication program produced over 9,500 positive readings during 1990. Leprosy is also a problem in some areas and at the end of 1990, leprosy hospitals had 249 patients including 58 new cases detected during the year.

Deliveries attended											
Home (b)	683	721	658	822	497	800	2,170	1,838	2,258	2,450	2,657
Hospital/Basic Units	213	310	489	1,460	1,817	3,007	2,491	3,086	3,588	3,513	3,576 + 2711
Total deliveries	896	1,031	1,147	2,282	2,314	3,807	4,661	4,924	5,846	5,963	
CHILD HEALTH SERVICES											
Attendance	4,608	6,321	8,524	11,967	17,734	23,996	33,240	26,090	35,784	25,465	22,672
First visit	36,688	36,543	36,084	65,526	93,275	90,754	163,161	136,450	151,526	156,979	16,721,9
Repeat visit	41,296	42,864	44,608	77,493	111,009	114,750	196,401	162,540	187,310	182,442	
Total attendance											
Malnourished children (c)	11,344	11,020	10,610	12,934	12,456	9,030	15,502	8,334	10,807	12,155	8,339
All malnourished	1,092	1,087	1,116	1,114	1,250	953	2,020	876	1,145	2,967	593
Third degree											

(a) Refers to total attendance, not a count of individuals. (b) Home deliveries are those attended by health staff. Many women attending health units for antenatal care have deliveries at home without attendance by health staff and are not included in the delivery figures. (c) Children attending health units are classified according to three degrees of malnourishment. Third degree malnourishment refers to the most severe cases.

## 4. HUMAN RESOURCES

### INTRODUCTION

The economy of Bhutan is characterized by the predominance of people engaged in self-employment, particularly those working their own land. There is also a good deal of small cottage industry often undertaken in the home. The number of persons working for wages is relatively small.

Statistics on human resources are designed to measure the involvement of people in economic activity. Economic activity refers to the production of economic goods and services and includes persons who are self-employed (e.g farmers operating their own land) as well as persons who work for wages (ie. employees).

Broadly, a statistical system for human resources (or labour) should cover topics such as size and characteristics of the labour force, employment, wage rates and conditions of work. Labour statistics may be obtained from three main sources :

a) Household Surveys, whereby information is obtained from the individual about his or her employment, earnings and other aspects of their working activities.

b) Employer Surveys, whereby information on number of persons employed and wage levels is obtained from employers.

c) Administrative sources, whereby various aspects of labour statistics are obtained from administrative sources (e.g. civil service employee data obtained from civil service employment were obtained from administrative records).

### MAIN FEATURES

In 1984, over 93 per cent of the population aged 15 to 64 were engaged in some economic activity, including 90 per cent of the males and over 96 per cent of the females. For males, 78 per cent were engaged in agriculture and 12 per cent in other activities, while for females over 95 per cent were engaged in agriculture and only one per cent in other activities.

As of December 1991, total civil service employment amounted to 11,228. There has been a substantial reduction in the number of the civil service employees since January 1987 as a result of the government's policy for a small, compact, efficient government.

## 5. LAND USE AND AGRICULTURE

### INTRODUCTION

Bhutan is predominantly an agricultural country with agriculture being the main subsistence occupation of the majority of Bhutanese people. For this reason, programs to increase and improve both the quantity and quality of agricultural products and for the country to achieve self-sufficiency in food grains and to have a marketable surpluses for sale, are of paramount importance in government planning.

Animal husbandry also plays an integral part in the farming system in Bhutan. Farmers keep cattle for draught and milking purposes, in addition to a few chickens and some pigs for slaughter. At higher altitudes, herds of yak and sheep are kept on pasture.

Efforts are under way to improve the statistical system for agriculture. During 1988 and 1989, the CSO in conjunction with the Department of Agriculture, undertook a detailed sample survey to collect information on crop areas and livestock inventories in all Dzongkhags. Some data from this survey (together with data from a pilot Agriculture Census undertaken in Wangdiphodrang in 1987) are presented in this chapter. Data from other sources are also presented.

### MAIN FEATURES

Bhutan covers a surface area of about 46,500 square kilometres. About 71 per cent of the country's total surface area consists of forest. 9 per cent is potentially able to be used for cultivation and the rest is wilderness.

During the year 1990/91, irrigation schemes were extended to cover newly constructed areas of 222.67 hectares and renovated areas of 77.47 hectares.

According to recent Agronomic Surveys undertaken by the CSO, there are an estimated 64,770 agricultural holders in Bhutan. The majority of the holders have less than 5 hectares of land, an estimated 27 per cent of holders have less than one hectare, while a further 30 per cent have between one and two hectares. Only 10 per cent have five hectares or more.

The main cereal crops grown are paddy, maize, wheat, mustard, barley, buckwheat and millet. The CSO Agronomic Survey reveals that in 1988 and 1989, the area under paddy, wheat, maize and mustard was 26,000, 6,400, 41,900 and 4,100 hectares respectively. Similarly, the production of paddy, wheat, maize and mustard were estimated to be 43,100, 4,100, 31,100, and 1,300 tonnes respectively. Other cash crops include potatoes, apples, chilies, ginger, oranges and cardamom.

The most important livestock in Bhutan are cattle, yaks, sheep, poultry and pigs. In 1990, there were about 308,300 cattle, 33,000 yaks, 43,700 sheep, 218,900 poultry and 59,600 pigs.

## 6. INDUSTRIES

### INTRODUCTION

The subject 'industries' covers the whole range of industrial activity carried out by businesses in all fields including mining, manufacturing, wholesale and retail trade, and other service industries. In Bhutan, the industrial sector has until recently, played a relatively small role in the economy of the Kingdom.

The mining industry in Bhutan is as yet relatively undeveloped. The Kingdom has significant deposits of a number of mineral resources, including limestone, coal, graphite, gypsum, slate and dolomite. Most mining activity is limited to relatively small operations, mainly involved in the mining of limestone, coal, slate and dolomite.

The manufacturing industry is dominated by a small number of major operators such as the Penden Cement Plant and the Gedu Wood Manufacturing Corporation. The first chemical plant - Bhutan Carbide and Chemicals Ltd. - was inaugurated during 1988. In addition, there are a number of smaller manufacturing plants concentrated in the food processing and wood products sectors. Cottage industries also play a prominent role with its good timber resources and favourable agricultural conditions, there is ample scope for expansion of the manufacturing sector especially in these areas.

As the industrial sector grows in Bhutan, statistics on industry will become increasingly important. The CSO will be giving special attention to the development of statistical systems to meet the important needs for industrial statistics in the future.

### MAIN FEATURES

There were 349 manufacturing and mining firms licensed in 1986, of which 14 were public-owned and 335 were in private ownership. A total of 249 firms were in the food industry, the majority of which were very small operations. The other important industry was wood and paper products with 55 licensed firms, over half of which employed more than 10 persons.

In the manufacturing sector as a whole, 285 firms employed less than 10 employees, 21 had employment within the range 10-19, 16 employed between 20-49 employees, while 18 had more than 50 employees.

## 7 - TRANSPORT AND COMMUNICATION

### INTRODUCTION

Traditionally the principal means of transport in Bhutan has been foot paths and mule tracks and these will continue to play an important role into the future. The development of the motor road network was initiated in 1961 with the commencement of work on the construction of the first road from Phuntsholing to Paro and Thimphu. The importance of road transport has grown with the expansion of the road network, and there are now extensive bus services between most centres in the Kingdom. Civil aviation arrived in Bhutan with the establishment of Druk Air Corporation and its commencement of operations in 1983 on the Paro - Calcutta sector. Services were extended to cover the Paro - Dhaka sector in 1986; Paro - Delhi in 1988; and Paro - Bangkok and Paro - Kathmandu in 1989.

Postal and other communication facilities were limited prior to 1962. Since then an extensive postal service has been developed so that the majority of the population now has reasonable access to mail services. Telephone services have also been considerably expanded and telex exchanges installed in Thimphu and Phuntsholing. An extensive civil wireless system also exists servicing many remote centres.

### MAIN FEATURES

By January 1991, there were 2,418.5 kilometers of motorable roads in Bhutan, of which 1,489 kilometers were black topped. As of January 1991, there were a total of 7,664 registered vehicles, in Bhutan.

Bus transport combines both public and private enterprise. A total number of 0.97 million passengers were carried in 1991/92. A total of 18,144 passengers were carried by Druk Air during 1991, an increase of nearly 5.8 per cent compared with 1990.

Post offices in Bhutan handled a total of 3.9 million items of mail during 1991 of which 2.2 million were domestic and 1.7 million were international.

## 8. ENERGY

### INTRODUCTION

The major source of energy in Bhutan has traditionally been firewood which is available in abundant quantities from the country's extensive forests. Firewood still represents a majority of energy consumption.

Electricity generation, though still relatively small in comparison with the rest of the world, is growing in importance. Up until recently, electricity generation was based on small diesel generating and micro hydro-stations, providing limited supplies of electricity which were supplemented by imports from India. With the commissioning of the first two units of the Chhukha Hydel Project during 1986, Bhutan substantially increased its electricity generation, and became a significant exporter of electricity to India. The final two units of the Chhukha project were commissioned during 1988.

### MAIN FEATURES

Total installed capacity at 1989/90 was 352.6 MW, of which 341.2 MW were generated from hydro power, 11.0 MW from diesel generating stations and 0.4 MW from micro hydel.

In the twelve months ending June 1989, total electricity generation was 1557.0 MU of which 1,544.3 MU was from the Chhukha plant. A total of 1,395.6 MU (90 per cent of electricity generation) was exported to India. Total sales to consumers in Bhutan amounted to 127.6 MU representing consumption per head of population of only 100 units. Some 28 towns and 221 villages have now been electrified with total consumers being 15229.

## 9. TOURISM

### INTRODUCTION

The tourism industry has been an important source of hard currency to Bhutan since the country was first opened to tourists in 1974. The potential as far as foreign exchange earnings are concerned is very high, though a strategy of regulating the number of tourists coming into Bhutan has been followed by the Government.

The main statistics of interest in the field of tourism relate to the characteristics of visitors and the details of existing tourist facilities. Interest centres on visitor arrivals, where they come from, and the purpose of their visit. Earnings of foreign exchange from overseas visitors is another important aspect.

### MAIN FEATURES

The total number of tourist arrivals in 1990 was 1,538, which is about 3.9 per cent more than the previous year. The highest number of tourists recorded was 2,524 in the year 1987. The largest numbers of tourists came from Japan, United States, and Germany (West). The majority of tourists (83 per cent) came on a tour, while, 17 per cent came for trekking and mountaineering. The arrivals in the months of March, September and October accounted for well over half of all arrivals.

## 10. BALANCE OF PAYMENTS

### INTRODUCTION

Bhutan's economy is closely linked with India, though efforts towards diversification of products and markets are actively pursued.

While economic links with other countries are limited, significant amounts of aid have been received in recent years and this has enabled substantial increases in imports from third countries. Exports to third countries continue to be very low and reliance is placed on inflows of aid for the financing of imports.

Balance of payments statistics are designed to show the difference between the total payments made to foreign countries and the total receipts from foreign countries. Payments and receipts include imports and exports of merchandise; services and transfers (such as freight and insurance charges); expenditure by travelers; and capital movements (such as loans and investments). The balance between imports and exports is measured by the trade balance. A more comprehensive picture of the balance of payments situation is obtained by including services and transfers to provide a measure of the current account balance.

The balance of payments statements also show how any negative current account balance is financed - in the case of Bhutan this is achieved through foreign aid. Any surplus of foreign aid over and above current account deficits means an increase in the foreign currency reserves of the country.

Balance of payments statistics in Bhutan are compiled by the Royal Monetary Authority based on information from its own accounts and those of the Bank of Bhutan, together with information on imports and exports. Efforts are under way to improve the data in a number of areas.

### MAIN FEATURES

During the period from 1982/83 to 1990/91, the trade balance deficit rose from Nu. 487.1 million to Nu. 606.9 million. In 1987/88, the deficit declined to Nu. 412.3 million with the result of the growth in exports of electricity from the Chhukha project to India. Imports grew sharply over the period 1982/83 to 1990/91 from Nu. 546.5 million to Nu. 1,994.6 million. Import part of this growth, rising from Nu. 100.0 million in 1982/83 to Nu. 332.1 million in 1990/91.

Foreign aid payments increased from Nu. 788.7 million in 1982/83 to Nu. 1050.1 million in 1990/91. Aid from India accounted for Nu. 729.1 million of the 1990/91 figure. In 1990/91, Indian

rupee reserves amounted to Rupees 246.0 million (an decrease of Rupees 430.0 million over the previous year), while convertible currency reserves amounted to \$US 78.8 million (an increase of \$US 38.7 million over the previous year).

In 1990, the chief exports to India were electricity (Nu. 376.8 millions), inorganic chemicals (Nu.171.7 millions) and cork and wood (Nu. 110.1 millions) and cork and wood manufactures (Nu.107 millions). At the same time, the major import from India were road vehicles(Nu.136.1 millions) petroleum and petroleum products(Nu.134.5 millions) and cereals and cereals preparations (Nu.128.4 millions)

However the export to the third country valued at (Nu.181.1 millions) of which vegetables and fruits had contributed(Nu.89.7 millions). The import at the same period amounted to (Nu. 225.0 millions), of which road vehicles was the single major contributor and amounted to (Nu.56.4 millions).

The value of the Ngultrum is pegged to the Indian rupee at one - to - one parity. In relation to the US dollar, there has been a continuous depreciation of the Ngultrum over the past few years, declining from a calendar year average of Nu.8.66 to the dollar in 1981 to Nu. 22.74 to the dollar in December 1991.

## 11. MONEY, BANKING AND FINANCE

### INTRODUCTION

Until recent times, most economic transactions in Bhutan were carried out on the basis of barter arrangements. The widespread use of money commenced during the 1960's with the expansion of trade with India and the inflow of development assistance. The Indian rupee was most commonly used until 1974 when the government first issued Ngultrum notes, Bhutan's official currency. The monetary sector has grown since then with increasing economic development, improvement in transport and communication facilities and greater urbanization, though the barter economy continues to be important.

The monetary sector in Bhutan comprises the Royal Monetary Authority, Bhutan's Central Banking organisation; and the Bank of Bhutan, the country's only commercial bank. The non-bank financial institutions are the Royal Insurance Corporation of Bhutan and the Unit Trust of Bhutan. In addition, a new non-bank financial institution, the Bhutan Development Finance Corporation was established during 1988 to provide long term loans for development purposes.

A statistical system for the money, banking and finance sector has been developed by the Royal Monetary Authority. The main element of the system is the monetary survey, which is a consolidation of the accounts of the Royal Monetary Authority and the Bank of Bhutan showing the financial relationships between the two institutions and other sectors of the economy. Items covered include foreign assets and domestic credit, together with information on the money supply. In addition, financial statements are also available for the two non-bank financial institutions.

### MAIN FEATURES

During 1990, there was an increase in the broad money supply (M2) of Nu. 102.2 million or 10.5 per cent from the previous year. This was largely accounted for by an increase in net foreign assets of Nu. 41.3 million.

From December 1983 to December 1990, there was an increase in net foreign assets of the Royal Monetary Authority and the Bank of Bhutan of Nu. 1,141.8 million. Domestic credit decreased by Nu. 12.7 million over the same period, mainly as a consequence of large increases in deposits of government with the Bank of Bhutan.

Investment in the two non-bank financial institutions has grown rapidly over the past few years. Between December 1983 and December 1990, total investment in the Royal Insurance Corporation of Bhutan increased from Nu. 137.5 million to Nu. 767.0 million while investment in the Unit Trust of Bhutan increased from Nu. 25.2 million to Nu. 378.9 million.

Loan amounts outstanding by the financial sector (including both banking and non-banking institutions) totalled Nu. 1035.6 million at the end of 1991. The use of those advances has changed over time with the building and construction industry in 1990 receiving 28 per cent of all advances compared with only 27 per cent in 1983. Agriculture received 4 per cent of advances in 1990, industry received 23 per cent and Trade and commerce received 17 per cent. However, the outstanding continued to remain lower in Agriculture and Transport sectors.

Interest rates on deposits with the Bank of Bhutan range from 5 per cent to 11 per cent. The Bank's interest rates on advances vary from 10 per cent to 15 per cent.

## 12. PUBLIC FINANCE

### INTRODUCTION

The system of modern public finance practices in Bhutan is of very recent origin. Traditionally taxes were being collected in kind; the levy on agricultural produce being on an average one fourth of the production of each farming family and labour contribution amounting to about two months labour for every adult. By 1960, as the government began to grow, institutionalization of public finances became a necessity.

In 1963, the position of a Finance Secretary was created in the Royal Secretariat and in 1968 the Ministry of Finance, one of the first few Ministries, was formed. In 1970 the system of payment of taxes in kind was largely dispensed with to be taken up by the system of cash taxes based on the type of land holding.

The first budget on modern lines was presented by the Ministry of Finance in 1971. It was called the 'Civil' budget as it covered only the needs of the Ministries of Finance, Home Affairs and Foreign Affairs. The requirements of development oriented Ministries like Communications and Tourism, Trade, Industry, Forests and Development were provided under a separate 'Development' budget administered first by the Development Secretariat, and then by its successor, the Planning Commission. With the commencement of the Fifth Five Year Plan the classification of the Government budgets into 'Civil' and 'Development' was replaced by the concepts of 'Maintenance' and 'Development' expenditures. 'Maintenance' or 'current' expenditures reflected mostly the current or consumption expenditures of the Government, while 'development' expenditures were identified largely with the expenditures of the Government on fixed capital formation.

### MAIN FEATURES

Government domestic revenue rose from Nu. 119.6 million in 1981/82 to Nu. 1711.0 million in 1990/91. Of this, Nu. 250.6 million was met from tax revenue, while Nu. 960.4 million were from non-tax revenue and other sources of revenue. Current expenditure in 1990/91, which is the second year of Sixth Five Year Plan, totaled Nu. 1027.6 decrease of 6 percent over 1989/91), while development expenditure totaled Nu. 932.7 million (decrease of over 18 per cent over the same period).

The Budget deficit in 1990/91 was Nu. 111.1 million, following a deficit of Nu. 269.1 million recorded in the previous year. Domestic revenue amounted to 54.3 per cent of total expenditure in 1990/91, with grants from India accounting for 19.7 per cent.

### ✓ 13. PLAN OUTLAYS

#### INTRODUCTION

Development planning in Bhutan can be traced back to the year 1961 when the first Five Year Plan (1961-62 to 1965-66) was drawn up.

Initially, a self contained Development Secretariat was established to implement the Plan. At the time of the preparation of the Third Plan in 1971, the Planning Commission was established headed by His Majesty, the King. In the absence of basic economic information and skilled manpower, the formulation of the Third Plan, like earlier ones was relatively simple. Major developments in regard to the consolidation of the planning process took place in the Fourth Plan period, when the Dzongkhags were involved in the development process.

Until 1981-82, the responsibility for making Plan allocations, raising internal resources, and negotiating foreign assistance etc. lay with the Planning Commission. In 1981-82, a large part of the financial responsibilities of the Commission was transferred to the Ministry of Finance. The Commission was however, invested with responsibilities for the formulation of development plans and allocation of investment resources.

A substantial infrastructure for development of the economy had been built up in the first Four Plans so that by the end of the Fourth Plan, the planning process had gained a good deal of comprehensiveness and sophistication. These two factors enabled the economy to develop the capacity of absorbing much higher volumes of investment resources for development in the later Five Year Plans.

The Fifth Five Year Plan was successfully completed in 1986-87. The Sixth Five Year Plan (1987/88 to 1991/92) will give emphasis to attaining the objective of economic self-reliance with progressively higher rates of growth and greater distributional equity among various sectors and regions. At the same time, it will lay renewed emphasis on the preservation and promotion of traditional values and ideals.

#### MAIN FEATURES

The total size or the plan outlay rose from Nu. 107.2 million in the First Plan period to Nu. 15,590.7 million in Seventh Plan period. Outlays for the Sixth Plan were over double those for the Fifth Plan. In the Seventh plan period, about 49 per cent of the total outlay was 'current' expenditure while 'capital' expenditure amounted to 51 per cent.

## 14. GROSS DOMESTIC PRODUCT

### INTRODUCTION

Human activities can be classified broadly into economic activities and non-economic activities. Economic activities are those which are devoted to making use of the scarce resources (including time and labour) in the production and distribution of economic goods, i.e. goods and services (needed to satisfy human wants) which are scarce in relation to demand and are transferable. Economic goods command a price on the market for their being scarce and transferable.

The end result of all economic activities that have taken place in an economy during an accounting period is reflected in Gross Domestic Product (GDP). GDP represents the money value of all the goods and services that have been produced within the territorial limits of the country and are available for final uses like consumption, gross capital formation and net exports.

GDP can be measured both at current and constant prices. When expressed at current prices it reflects the money value of the final goods and services produced in an accounting year measured in the prices of that year. On the other hand GDP expressed at constant prices reflects the money value of such goods and services for all the years measured in one year's (base year) prices. In this case the base year prices are kept constant for evaluation purposes for all the years under review. For measuring the performance of the economy in regard to the production of economic goods and services in real terms over a period constant price estimates of GDP have to be taken into account. Current price estimates of GDP give a view of the levels of production performances of the economy for all the years under review at changing current prices.

## 15. PRICES

### INTRODUCTION

The only price statistics currently compiled in Bhutan relate to the Consumer Price Indexes, often referred to as the CPI. The CPI has been produced by the CSO twice a year since December 1979. In addition, a food price index for Thimphu has been produced each quarter since September 1987.

The purpose of the CPI is to provide a general indicator of the rate of price change for consumer goods and services. The CPI is important in monitoring overall price development and assessing changes in the living standards of the population.

The CPI is formed by measuring the change in the cost of purchasing a 'basket' of consumer goods and services, where items in the 'basket' are weighted according to their relative importance in the total spending of consumers. The 'basket' includes food items (e.g. rice, other cereals, vegetables, oils and fats, and spices) together with non-food items such as clothing, fuel, furniture and other personal items. Items such as cereals are weighted more heavily than say furniture, because they represent a larger proportion of consumer expenditure. A price change in cereals will therefore have a greater effect on the CPI than a price change for furniture.

The CPI is presented as index numbers, where the indexes are measured relative to the base of June 1979 = 100.0. Price change is estimated by measuring change in the index numbers.

### MAIN FEATURES

In December 1991, the rate of inflation in Bhutan as measured by the change in the Consumer Price Index over the previous twelve months was estimated to be 13.3 per cent. This indicated that prices for consumer items in Bhutan as a whole rose by an average of 13.3 per cent over this twelve month period. This compares with a rate of 9.4 per cent recorded in the twelve months to December 1990.

Prices for food rose by an average of 15.1 per cent in the twelve months to December 1991, while prices for non-food items rose by 9.7 per cent over the same period.
