Ministry of Agriculture and Forests**

**Processing  
and  
Analysis**

**RNR-Statistical Coordination Section  
Policy and Planning Division  
Ministry of Agriculture & Forests**

## **A: Methodology**

### **A1: Design of the Survey**

The survey questionnaire used for the Agriculture Survey 2011 was the revised version of the Agriculture Survey 2010. The revision was done by Agriculture Extension and Information Management Section (AEIMS) of the Department of Agriculture (DoA) in consultation with representatives of all twenty dzongkhags and technical support from RNR Statistical Coordination Section (RNR-SCS) of the Policy and planning Division (PPD), Ministry of Agriculture and Forests (MoAF).

The purpose of the revision was to do away with some of the unwanted data variables in the previous questionnaire and to include data items that can be useful for measuring the development indicators reflected in the 10<sup>th</sup> Five-Year Plan of the RNR sector.

### **A2: Sample Selection Procedures**

Given that the geographical distribution of crops is based on the different ecological and climatic conditions, it is not feasible to produce precise survey results for all crops in each geog. Moreover, as it used to be in the past surveys, application of a uniform of 10 percent sample selection system across all the geogs (sub-districts), although produce reliable results for the larger geogs with 300 or more households, its precision for the smaller geogs with less than 300 households appeared to be very poor. This has given an impression that the level of precision of the survey estimates would be increased with increased sample size for smaller geogs with less than 300 households.

Therefore, for the agriculture survey 2011, the sample sizes ranging from 10 percent to 50 percent have been adopted depending on the size of the geogs. At least 115 (56.1%) geogs accounted for 10% sample, 39 (19.0%) geogs for 11-14% sample, 26 (12.7%) geogs for 15-20% sample, 15 (7.3%) geogs for 21-30% sample and 10 (4.9%) geogs for the sample sizes greater than 30% sample. The average sample size or the households selected for the survey at the national level stands at 12 percent of the total rural households of the country.

### **A3: Data Collection**

The data collection was carried out during April-May 2012 and as usual, by agriculture extension officials (EAs) posted in the geogs under supervision of dzongkhag agriculture sector heads. Twenty assistant dzongkhags agriculture officers (ADAOs) were briefed on the use of the questionnaire, who in turn trained the field agriculture staff on the use of the questionnaire for data collection.

### **A4: Data Entry**

The data entry into the database developed by the (RNR-SCS) was executed by Assistant Dzongkhag Agriculture Officers (ADAO) from 20 dzongkhags at a private IT institute in Thimphu in July 2012. The data entry works was closely monitored by the AIEMS.

### **A5: Data Processing and Analysis**

Because of lack of statistical capacity at the AIEMS in DoA, at least for this survey, the RNR-SCS in PPD had taken over the charge of the data processing and analysis. The processing and analysis of data at the RNR-SCS started from the last week of August 2012 and completed in September 2012.

### **A6: Estimation Procedures**

In order for the estimates from the sample survey to be representative of the population, it is necessary to multiply the data by a sampling weight, or expansion factor. The basic weight for each sample household would be equal to the inverse of its probability of selection. The sample design for the agriculture survey 2011 was a self-weighting within stratum, meaning that all the sampled or the enumerated households within a geog will have the same weight.

#### ***Adjustment for non-response***

In order to adjust for the loss of representativeness caused by non-responding households, the weight of the responding units ( $W_{t,E_h}$ ) was increased by deploying the following formulae.

$$W_{t,E_h} = \frac{S_h}{E_h}$$

Where:  $S_h$  = Sampled households in the geog  
 $E_h$  = Enumerated households in the geog  
 $Wt\_E_h$  = basic weight for enumerated households in the geog

### ***Weighting for probability of sample selection***

Based on the one-stage stratified sample design, the probability of selection for the sample households in a geog was calculated as follows:

$$Wt\_S_h = \frac{N_h}{S_h}$$

Where:  $N_h$  = Total households in the geog  
 $S_h$  = Sampled households in the geog  
 $Wt\_S_h$  = basic weight for sampled households in the geog

Finally, the estimation for observed values in the geogs has been obtained by deploying the following formulae.

$$\sum_{N_h \square} = \frac{S_h}{E_h} \times \frac{N_h}{S_h} \times \boxed{?} = Wt\_E_h \times Wt\_S_h \times \boxed{?}$$

Where:  $N_h$  = Total households (sampling frame) in the geog  
 $S_h$  = Sampled households in the geog  
 $E_h$  = Enumerated households in the geog  
 $\square$  = Sum of observed value of enumerated households in the geog

$$\sum N_h \square = \text{Estimated observed value for total households in the geog.}$$

## B: Survey Coverage and Scope

Of the total rural households (list gathered from geog extension centers) of 65,677, at least 7,605 (12% on average) were selected for enumeration. The coverage however, was 6,364 (88%) of the total sampled households of 7,605. The non-response or the absentees stood at 11.6% percent (885) of the households selected for the survey.

At least four dzongkhags of Dagana, Sarpang, Pemagatshel and S/Jongkhar accounted for non-response of 10% to 11%, Trashigang, Chhukha, Mongar, Paro, Trashiyangtse accounted for 5% to 8%, Tsirang, Thimphu and Zhemgang accounted for 3% to 4%, Wangdue, Ha, Trongsa, Punakha and Samtse for 1% to 2% and Lhuentse, Gasa and Bumthang for less than 1% of the national 11.6% non-responded households.

Table 1: Coverage of rural households by the survey 2011

Dzongkhag	Total HH (Sample frame)	Sampled HH	Percent Sampled	Enumerated HH	Percent Coverage
	[N <sub>h</sub> ]	[S <sub>h</sub> ]		[E <sub>h</sub> ]	
Bumthang	1,364	146	11	145	99
Chhukha	3,369	435	13	373	86
Dagana	3,881	463	12	361	78
Gasa	542	120	22	117	98
Ha	1,461	185	13	168	91

Tsirang	3,251	366	11	334	91
Wangdue	2,860	447	16	423	95
Zhemgang	2,099	250	12	212	85
Bhutan	65,677	7,605	12	6,709	88

## **Summary of Key Results**

In general, to a greater extent, it has been found that the quality of data collection has improved. The precision level of the survey results was better for all geogs as compared to the previous surveys. The improvement in the level of precision is believed to be contributed by increased sample size for the smaller geogs with less than 300 households, enhanced capacity of field staff in data collection and supervisory aspects and procedures adopted for estimation of the results.

Following are the summary statistics resulted from the Agriculture Survey 2011.

Table 2: Cereals production

Crops	2011		
	Area (Acres)	Production (MT)	Yield (Kg/Acre)
Barley	3,927	3,110	792
Buckwheat	10,547	8,337	794
Maize	70,312	79,826	1,135
Millets	9,194	7,064	768
Paddy	59,609	78,730	1,312
Wheat	5,802	6,266	1,080
All cereals	158,841	182,404	1,148

Table 3: Fruits production

Crops	2011			
	Tot Trees (Nos)	Bearing Trees (Nos)	Production (MT)	
			Yield (Kg/Tree)	
Apple	698,072	557,780	20,752	37
Mandarin	3,122,356	1,719,637	60,993	35
Mango	51,688	16,250	451	28
Banana	488,759	174,816	2,439	14

## 5. Road access

The road access refers to the accessibility of farming households to any type of roads that are pliable for motor vehicles.

Table 38: Proportion of rural households by walking distance to motor-road points (2011)

Dzongkhag	Total Geogs	Proportion of geogs with more than 70% of their households residing within 1 hour walking distance	Proportion of geogs with more than 70% of their households residing above 6 hours walking distance	Proportion of households by walking time taken to reach nearest motor-roads points			
				(-) 1 hour	1 to 3 hours	4 to 6 hours	(+) 6 hours
Bumthang	4	100.0	0.0	95.7	4.3	0.0	0.0
