DEPARTMENT OF AGRICULTURE
Royal Government of Bhutan
Ministry of Agriculture
Tashichhodzong: Thimphu

Foreword

This is the annual publication of Agriculture statistics containing data on area and production of crops for the year 2007. We hope that the data will provide better understanding of the sector to make informed decisions and plan programs for rural development. The national agriculture survey is challenging given resources and time, we do not claim that the data are as accurate as they should be. We hope to improve the data collection procedures as we progress.

The data are presented in two volumes. Volume-I contains brief description of objective, survey design, methodology, coverage and the limitation. Volume-II is an annex to Volume I that presents data by gewogs in sub-volumes

The Department of Agriculture would like to extend appreciation to all agencies particularly the dzongkhags and gewogs for their support and cooperation in bringing out this publication.

I would also like to extend appreciation to all colleagues in the department for bringing out this publication.

Chencho Norbu
DIRECTOR

Date: 5th January 2009

1. Introduction

This publication of agriculture statistics 2007 features area, production and yield of main field crops and horticultural crops. The publication also provides secondary information on agriculture commodities and infrastructure related information in the agriculture sector.

1.1 Objectives

The main objectives of the survey are:

- To establish reliable information on crop production and land use for planning and monitoring of agriculture development programmes.
- To generate data needed for preparation of the plans, programs and to assess the trends in crop production and land use.
- To initiate development of time series data.
- Strengthen agriculture information database

1.2 Survey Methodology

Sampling design

The survey adopted a Linear Systematic Sampling scheme without replacement for the sample selection. All the 205 Geogs in the country served as the domain for the sample survey. All the Geogs were included in the sample survey in order to cover different ecological resources endowment, and development stages. A household is the lowest sampling unit. The rural farming households of each Geog served as the sampling frame from which a 10 percent sample was chosen uniformly from all Geogs irrespective of the sizes and economic activities undertaken. No further stratification was adopted.

Scope and coverage

The survey is focused on the rural farming households. Information Management Section (IMS), DoA took the lead in preparing of questionnaires and co-ordinating the survey. Attempts were made to cover all 205 geogs in the country.

The survey covered 6,117 rural households out of 64,815 households in the country. There were some absentees or non response due to problems with the listings and farmers away on pilgrimage and on holidays. The definition of the household in this survey is having registered and cultivated land and residing in the village. The publication has not presented figures for less than 3 samples.

Sampling Procedures

The Information Management Section (IMS), DoA in consultation with the DAOs and extension agents selected the sample households based on household lists maintained in the geog centres. The sample was drawn randomly from the household list submitted by the extension staff using Linear Systematic Sampling scheme to identify the required 10 % sample. This sample list was distributed to the enumerators for identification and interview. In the event that the sampled farmer was not available for interview after repeated visit, then the next farmer from the same locality was selected.

1.3 Field Operation

Prior to the survey, all the Geog Agriculture Extension Agents were trained on the content of questionnaire, methodology and sample list. The survey questionnaires were also distributed along with the sample lists. The work plan was discussed and the enumeration was conducted from December 2007 till March 2008.

1.4 Data Editing, Processing, Validation and Analysis

The following steps were followed for processing the data:

1. Inconsistencies at geog level were eliminated by the extension workers by comparing the yield from the annual crop cut and annual statistics.
2. Data that had extreme values as reported by the farmers were compared by our field staff and those that showed large differences were deleted.
3. Data reported in local units were converted to standard measurement units. Farmers use local measurement units that differ from place to place. Instead of reporting in Kg and Acre farmers report in langdo, bags, baskets, etc.
4. All ADAOs of 20 Dzongkhags were trained on the operation of the database and analysis in May 2008 in Paro. Thereafter analysis was done by the ADAOs in their respective Dzongkhags. The data was submitted by DAOs by July 2008.
5. IMS, DoA conducted the workshop to reconcile and validate the data submitted by DAOs. The workshop was attended by concern agriculture geog staff, ADAOs and DAOs. This exercise was completed in September 2008. The first draft report was presented to the department for further reviews and formal endorsement.
6. The DoA endorsed the draft report in November 2008.

1.5 Limitations of the survey

Some of the limitations of the survey are as follows:

- The respondents are farmers with diverse social and educational background. Therefore, response errors are likely to be high although various techniques were used to get accurate responses.
- The respondents do not maintain farm records, costs of production, inputs etc.
- Tendency to underreport is noticed as there is a notion of higher taxation if accurate figures of production are reported.
- As 10 percent sample were taken from all the Geogs irrespective of their size, the estimates for certain crops with small number of households in a gewogs will have to be taken with caution as the sample size will be too low to provide reliable estimates.
