FOREWORD

The Ministry of Agriculture and Forests (MoAF) is pleased to release the Annual Livestock Statistics 2020, the 15th series which is the joint publication by the Renewable Natural Resource Statistics Division (RNR-SD) and the Department of Livestock (DoL).

The Livestock Statistics present information on livestock types and the production in the country. The report contains production statistics at Dzongkhag level and the additional statistics disaggregated by gewog to enable reliable estimates of livestock related indicators. I hope that the report will be a key source of information for policy makers, planners and international community.

Accurate data on livestock production and productivity are essential for government to develop, monitor and evaluate the impact of policies and investments in the livestock sector. The quality of livestock data depends on the data collection system adopted and the support received from various stake holders. Therefore, I would like to thank RNR Statistics Technical Working Group (RS-TWG), officials of RNR Statistics Division (RNR-SD) and Department of Livestock (DoL), Government livestock input farms and Gewog Livestock Extension Supervisors (GLESSs) for their constant effort and support in bringing the publication on time.

A handwritten signature in blue ink, appearing to read "Rinzen Dorji".

(Rinzen Dorji)
SECRETARY

PREFACE

Annual Livestock Statistics 2020, published jointly by RNR Statistics Division (RNR-SD) and the Department of Livestock (DoL) provides comprehensive information on livestock related indicators. Through this report, the RNR-SD consolidates statistics and indicators that can respond to the needs of our data users for effective decision making.

As the RNR-SD strives to improve its statistical publications and services, we would like to welcome comments and feedbacks on the contents and format of this publication. I on behalf of the RNR-SD, I would like to convey our appreciation and gratitude to all the Livestock Extension Supervisors and Dzongkhag Livestock and Production Officers for their continued support and cooperation in collecting data from farmers.

Further, I would like to thank technical guidance and support of RS-TWG for their unwavering support and facilitation for the improvement of RNR statistics in the country. Finally, I would also like to thank all our valued livestock farmers and government livestock input farms for sharing the information.

A handwritten signature in blue ink, appearing to read "Rabgye Tobden". It is written in a cursive style with some loops and flourishes.

(Rabgye Tobden)
DIRECTOR
Directorate Services
Ministry of Agriculture and Forests

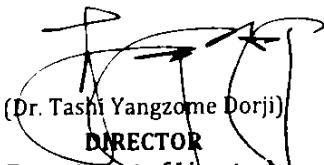

ACKNOWLEDGEMENT

Annual Livestock Statistics 2020 is the 15th series of statistical publication jointly published by RNR Statistics Division (RNR-SD) and the Department of Livestock (DoL) in our continued effort to document livestock population and production data in the country for better planning and efficient resource utilization.

I hope that this statistical data will be useful, not only for the planners and researchers for development work, but also for the policy makers. It is my sincere hope that as we move towards evidence-based decision making, the available data will be useful to all stakeholders for holistic RNR development in our country.

I would like to extend my heartfelt appreciation to all my colleagues in the Department, Dzongkhag/Gewog livestock sector, Government livestock input farms and colleagues in RNR-SD for all their efforts in bringing out this publication on time.

(Dr. Tashi Yangzom Dorji)
DIRECTOR
Department of Livestock
Ministry of Agriculture and Forests

CHAPTER 1: INTRODUCTION

According to the World Census of Agriculture 2020 (WCA 2020), raising and breeding livestock is an economic activity that is a part of agricultural activities in a broad sense. The term “livestock” refers to “all animals, birds and insects kept or reared by the agricultural holdings mainly for agricultural purposes. This includes cattle, buffaloes, horses and other equine animals, sheep, goats and pigs, as well as poultry, bees, silkworms etc.” Domestic animals, such as cats and dogs, are excluded unless they are being raised for food or other agricultural purposes.

Box 1: What is included in Livestock statistics?

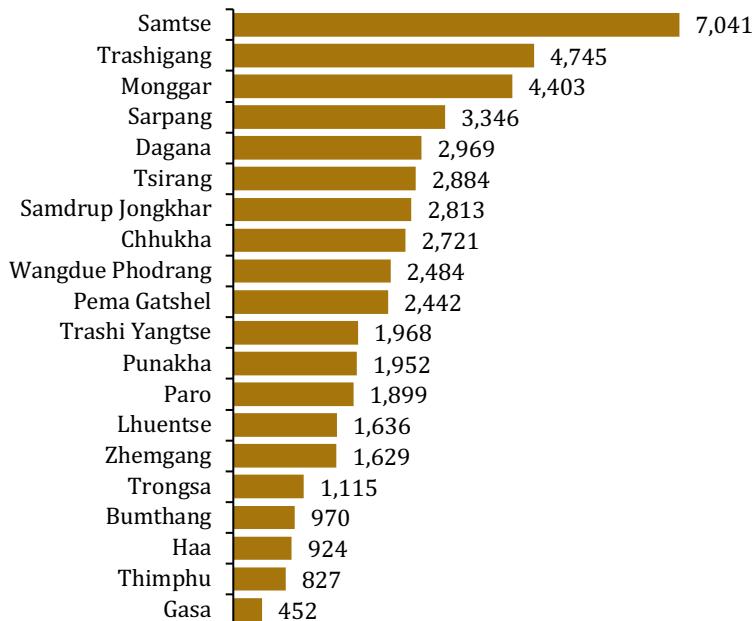

1.1 Background

Following the definition of WCA 2020, the Annual Livestock Census of Bhutan (ALC 2020) was jointly conducted by RNR-SD and the DoL. It endeavours to present a comprehensive information on livestock stock and animal production in the country for better policy planning and efficient resource utilization.

The Annual Livestock Census (ALC 2020) enumerated 49,220 livestock households and collected data on the livestock population and production.

Figure 1.1 shows the distribution of livestock holdings by different dzongkhags. Across the dzongkhag, Samtse (about 14 percent), Trashigang (about 10 percent) and Monggar (about 9 percent) have the highest number of livestock holdings compared to rest of the dzongkhags.

Figure 1. 1 Distribution of livestock holdings by dzongkhag, 2020

The livestock statistical report is organized as follows. Chapter 1 discusses the relevance and objectives of conducting the census, followed by outlining principles of data acquisitions: collection practicalities, operational issues and addresses the data collection methods used for holdings in the household sector and for holdings in the non-household sector.

Chapter 2 focuses on the results of the census and provides main statistical tables in terms of livestock numbers and production which are expected to be useful to the Government and other development

partners to assess achievements in the RNR Sector and further help in formulating plans and policies based on the data. The main statistical tables include livestock stock (number of livestock) and animal production (meat, dairy and eggs) and utilization by core livestock type at the national level.

Chapter 3 includes the livestock stock and animal production and utilization by core livestock types at the gewog level. Furthermore, additional information on livestock population and production in government livestock input farms are also included in Chapter 4.

1.2 Objective

The livestock data of high quality in terms of accuracy and timeliness are important to guide decision-making and investment decisions. Considering the importance of livestock data, the following are specific objectives of the 2020 Annual Livestock Census:

- To record and maintain reliable information on livestock population and production for development and implementation of food security programmes;
- To establish reliable information on livestock population and production for planning and monitoring of livestock development programmes;
- To collect information on livestock indicators like annual livestock population by different breeds, production, etc for development, promotion and monitoring of economic growth; and

- To provide time series data of livestock population and production for development of livestock-sector investment strategies.

1.3 Reference period

The information collected in the 2020 ALS refers to the household's information for the year 2020. The reference is made to 15th December, 2020 for which the data is collected.

In the census, the *Computer-Assisted Personal Interviewing (CAPI)* method was employed for the first time in livestock sector to collect the data from household sector while the *Computer-Assisted Web Interviewing (CAWI)* method was employed to collect the data from non-household sector, particularly from the government input livestock farms.

Livestock Extension Supervisors in 205 Gewogs and representatives from respective government farms enumerated the census from 1st November to 15th December 2020. However, due to Covid-19 pandemic, the census was postponed by another two weeks.

1.4 Virtual training

Since the census employed tablet-based field data collection for the first time, the RNR Statistics Division (RNR-SD) had to virtually trained all Gewog Livestock Extension Supervisors (GLESs) on interviewing technique using the CAPI. While conducting in-person CAPI training was observed effective for several reasons, GLESs had to be trained virtually due to the COVID restrictions.

Prior to the CAPI virtual training, the content of the questionnaire and any other issues regarding the operation of the census was developed by RNR-SD in consultation with the officials from the Department of Livestock (DoL).

A day CAPI virtual training for respective GLEsS was provided in October 2020 on how to administer a questionnaire with mock demonstrations followed by Q&A session with the GLEsS. A field test in consultation with Thimphu District Livestock Officials (DLOs) and their respective GLEsS were conducted. The GLEsS from Thimphu Dzongkhag checked the adequacy of the questionnaire with the team from RNR-SD and DoL, and rectified mistakes if any in the CAPI-based questionnaire by the RNR-SD.

1.5 Quality control process

The quality of data is of primary importance for accuracy, relevance, reliability and validity of results. The RNR-SD team implemented measures to prevent unacceptable practices and to minimize errors in the data collection.

To ensure data quality, attention was paid starting from the design of the questionnaire through participatory approach and fine tuned for the most relevant information with the Department.

The officials from RNR-SD validated data collected by supervising different GLEsS for CAPI data collection and data were validated at the enumeration level. Similarly, the completed household were also checked thoroughly at the HQ.

Furthermore, the RNR-SD team validated enumerated data by checking the distribution of the data in terms of livestock population and production. Where necessary, the RNR-SD team also randomly

called livestock households that needed further data validation and GLESSs were also consulted.

1.6 Data processing

Field data collected through CAPI software were analysed using the STATA software. The analysis and report presentation were guided by a tabulation plan in consultation with the DoL. Furthermore, the analysis results underwent several rounds of internal review.

CHAPTER 2: LIVESTOCK POPULATION AND PRODUCTION-NATIONAL LEVEL

In many developing countries, livestock production contributes to approximately one-third of the value added from agriculture (FAOSTAT, 2013). In Bhutan, the livestock-sector continues to play significant role in enhancing food self sufficiency and nutrition security. At large, it plays important role in reducing rural poverty and enhancing rural livelihood. Given the importance of the sector to the economy, the need for quality livestock statistics has become imperative. This chapter provides statistics on livestock stocks (number of livestock) and animal production (meat, milk and eggs) by core livestock types in Bhutan.

Box 2: Importance of livestock statistics

2.1. Livestock population

The livestock is an essential part of the farming system across many districts of Bhutan. It has a wide range of livestock production system. This includes cattle, yak, buffaloe, horse, mule, donkey, sheep, goat, pig and poultry. The utility-dog and cat population included under this livestock statistics are those that provide admin-support services to the household sector in rural areas. Table 2.1 shows the summary of livestock population in the country by type in 2020. Furthermore, respective bred population are provided (Table 2.6-2.26). The summary of livestock death is also provided (Table 2.27) and the number of beehives (Table 2.28) in the country.

2.2. Livestock production

To enhance production efficiency, diversification and value addition, the Ministry of Agriculture and Forests has been promoting innovative and resilient dairy farming technologies. Furthermore, to enhance domestic production for import substitution the native poultry farming has been promoted as a resilient farming practice. Table 2.2 – 2.5 present different livestock production by type and by dzongkhag in 2020.

Table 2. 1 Summary of livestock population in Bhutan by type, 2020

| Dzongkhag | Bovine population | | | | | Other livestock population | | | | | | |

CHAPTER 3: LIVESTOCK POPULATION AND PRODUCTION- GEWOG LEVEL

Livestock data at granular level are vitally important to guide policy-making and investment decisions in livestock sector. Continued development and improvement of data at the disaggregated level has the potential to pay dividends in the longer term in the form of reliability and quality of the data at the national level. This chapter presents statistics on livestock stock and animal production by 205 gewogs in the country.

Box 3: Why livestock statistics at granular level?

3.1. Livestock population

Gewog level livestock population and production statistics are important to enhance understanding of the gewog livestock operations of the holdings in the country. These are important information which will enhance the evidence-based decisions to develop and implement effective policies and programs related to livestock sector in the country.

Table 3.1-3.15 show the summary of livestock population by gewog and by type in 2020. The summary of other livestock population by gewog and by type in 2020 are also provided in Table 3.16-3.21.

3.2. Livestock production

Table 3.22 – 3.25 provide respective dairy production by gewog in 2020. The meat production by gewog in 2020 are also included in Table 3.26-3.27 while other livestock production by gewog such as eggs, wool and honey are provided in Table 3.28. Furthermore, Table 3.29 -3.30 present bovine and other livestock death in 2020 while Table 3.31 shows the number of beehives by gewog and by type in 2020.

CHAPTER 4: LIVESTOCK POPULATION AND PRODUCTION BY GOVERNMENT LIVESTOCK INPUT FARMS

Like in many countries, the population of livestock holdings in Bhutan is also divided into two subpopulations: (i) holdings in the household sector and (ii) non-household sector. According to FAO, the holdings in the non-household sector are defined as holdings that are in sectors other than the household sector, such as corporations and state-owned farms. The holdings in the household sector are holdings that are operated by a civil (natural) person or group of civil (natural) persons. Examples are sole proprietorships and most partnerships. However, holdings whose holder has legal status fall outside the household sector. This chapter presents livestock stock and animal production by non-household sector—particularly, the government livestock input farms in Bhutan.

Box 4: Subpopulation of livestock holding

4.1. Livestock population

To sustain contribution of RNR sector to the national economy, government livestock input farms play integral role. For example, Naitonal Dairy Research and Development Centre (NDRDC) supports livestock farmers with Artificial Insemination (AI) services. Among many others, the National Piggery Research and Development Centre (NPiRDC) also maintains exotic pig breeds to enhance self-sufficiency in pork production. Table 4.1-4.2 presents livestock and other livestock population in the government livestock input farms in 2020. An additional information on livestock death is also provided in Table 4.4.

4.2. Livestock production

Government livestock farms also play significant roles in enhancing domestic production. Eg. the National Poultry Research and Development Centre (NPRDC) supports poultry farmers with the production of quality DoC. The information on dairy and meat production by government input farms are provided in Table 4.3.
