

LABOUR FORCE SURVEY STATISTICS BULLETIN QUARTER FOUR, 2025: KEY FINDINGS

NATIONAL STATISTICS BUREAU

**The Overall Unemployment Rate in Quarter Four 2025 is
3.8% with Youth Unemployment Rate of 20.6%**

INTRODUCTION

The Labour Force Survey (LFS) plays a vital role in generating key labour market indicators that inform national planning and policy formulation. Data from the LFS not only supports the monitoring and evaluation of the country's economic performance but also contributes to the design of employment-related programmes, poverty reduction strategies, and other socio-economic initiatives.

The 4th Quarter Labour Force Survey was conducted in November 2025, covering a total of 2,928 households across 19 dzongkhags. Of the selected households, 2,865 participated in the survey, resulting in an overall response rate of 97.8%.

Most indicators are available at the domain level. The survey follows the labour force framework and standards of the International Labour Organization (ILO), ensuring that the results are internationally comparable.

Key Indicator (%)	2024				2025

I. Labour force participation rate in quarter four remains at around 65%

SURVEY FINDINGS

In Q4 2025, 77.6% (604,696 persons) of the total population were aged 15 years and above, constituting the working-age population. Of this, about 52% were male and 48% female; 36% resided in urban areas and 64% in rural areas. A total of 390,856 individuals were economically active, with males accounting for about 59% and females 41%. Economic activity is higher in rural areas (66.6%) compared to urban areas (33.4%). The Labour Force Participation Rate (LFPR) the proportion of the working-age population that is economically active stands at 64.6% in Q4, 2025. The rate is higher among males (72.7%) than females (55.8%), and higher in rural areas (67.7%) than in urban areas (59.3%) (Figure 1b).

Compared to Q4 2024, the LFPR remained broadly stable, with only a marginal change over the year. It decreased by 0.9 percentage points from Q3 2025, on a quarter-on-quarter basis (Figure 1a).

III. Education and Family duties are the main reasons for being outside labour force

In Quarter four, 2025, the proportion of persons outside the labour force increased by 0.9 percentage points from the previous quarter. Compared to the same quarter in 2024, the inactivity rate increased by 0.2 percentage points, from 35.2% to 35.4%.

The urban inactivity rate is 40.7%, while the rural rate remains consistently lower at 32.3%. A marked gender disparity persists: female inactivity stands at 44.2%, 17.0 percentage points higher than the male rate of 27.3%, reflecting continued gender gaps in labour force participation (Figure 2a).

Education and family duties remain the leading reasons for being outside the labour force. A large share of males reported studies or training as their main reason, while females predominantly cited household and family responsibilities. This highlights a strong gender disparity in labour force non-participation.

In addition, about 17% of individuals outside the labour force reported retirement or pension, as their reason for non-participation (Figure 2b).

III. The employment rates remained stable, averaging 96-97% across Quarters.

In Quarter 4, 2025, the overall employment rate stands at 96.2%, showing a slight decline from 96.8% in the previous quarter. Compared to the same quarter last year, the rate is also slightly lower, reflecting minor fluctuations in employment.

The employment rate stands at 96.9% for males and 95.0% for females. By area of residence, the urban (92.5%) employment rate is lower than that of rural areas (98.0%). This is due to the engagement of the high proportion of rural residents in own-account agricultural work, particularly farming on their own land (Figure 3a).

Among the 390,856 employed persons, 46.3% are engaged in the agriculture sector, 40.9% in the services sector, and 12.7% in the industry sector. Among employed males, a higher proportion are engaged in the services and agriculture sectors, whereas among employed females, a higher proportion are engaged in the agriculture sector (Figure 3b).

In Quarter 4 of 2025, the employment distribution reveals that approximately 35.5% of the total employed population were paid employees, including both regular and casual workers. Own-account workers, engaged in either agricultural or non-agricultural activities, accounts for 34.2%, while family contributing workers comprises around 30.3% of the workforce. A notable gender disparity is observed across these employment categories, indicating differences in the nature of work undertaken by men and women (Figure 4a).

The mean monthly labour income for employed persons is Nu. 25,720. Male employed persons earn a mean income of Nu. 28,361, which is Nu. 7,702 higher than their female counterparts. Additionally, male employed persons have higher mean monthly incomes than female employed persons in both urban and rural areas (Figure 4b).

IV. Overall Unemployment Rate Stands at 3.8%, While Youth Unemployment remains over Five times higher in the Quarter

In quarter four 2025, the national unemployment rate stands at 3.8% (95% CI: 2.9, 4.8), slightly higher than 3.2% (95% CI: 2.5, 4.0) in Quarter 3. The overlapping confidence intervals indicate that the observed difference is not statistically significant.

Compared to the same quarter in 2024, the rate is 0.7 percentage points higher. By sex, the unemployment rate is 3.1% for males and 5.0% for females (Figure 5a).

While the overall unemployment rate indicates near full employment, youth unemployment remains a persistent concern. Of the total unemployed persons actively seeking and available for work in Quarter 4 of 2025, 42.2% were youth aged 15–24. The youth unemployment rate stands at 20.6% (95% CI: 13.8, 27.3), reflecting a 2.8 percentage point increase from the previous quarter. On a year-on-year basis, the rate increased by 2.8 percentage points compared to the same quarter of the preceding year (Figure 5b).

The unemployment rate is highest among younger age groups. It remains above the overall unemployment rate until the 25-29 years age group, after which the unemployment rate declines steadily and flattens from age 45 onwards (Figure 6a).

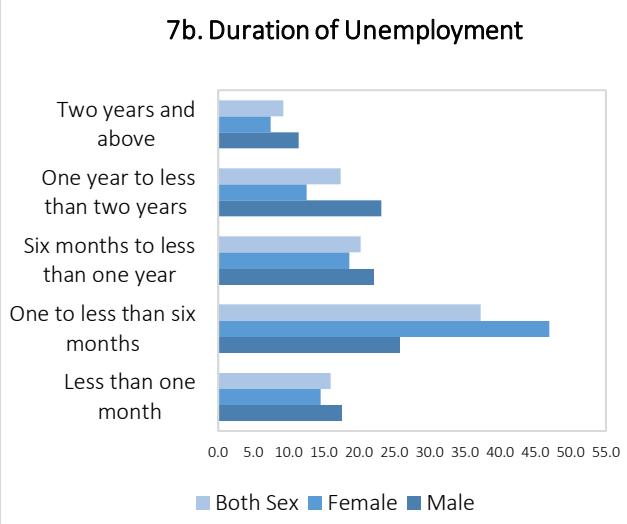

The unemployment rate is higher among younger age groups. It remains above the overall unemployment rate until the 25-29 years age group, after which the unemployment rate declines steadily and flattens from age 45 onwards (Figure 6a).

Similarly, the number of unemployed persons peaks in the 20-24 years group before declining thereafter. This decline in unemployment rate with age may reflect typical life-cycle patterns of labour market entry, accumulation of work experience, and increasing job stability.

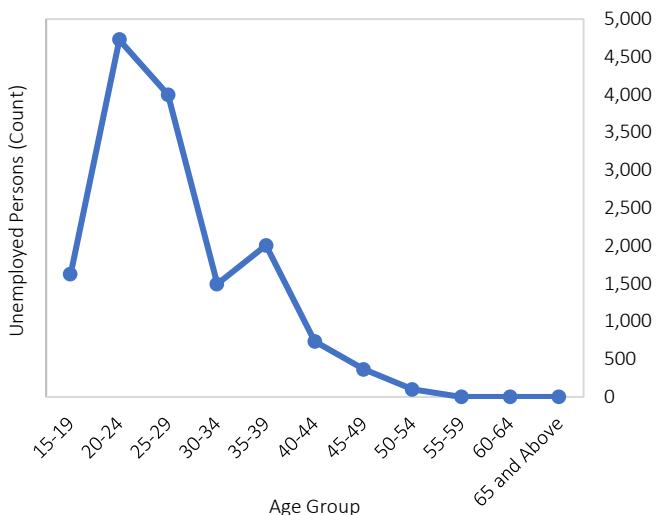

7a. Reasons for being Unemployed

7b. Duration of Unemployment

6b. Number of Unemployed Persons by Age Group

Information on reasons for unemployment shows that among several cited causes, the major ones include recently completed studies (22.7%), lack of adequate qualification (21.0%), lack of experience (17.2%), voluntarily resigned (13.9%), and qualification mismatch (7.9%) (Figure 7a). This pattern of reasons for unemployment is consistent across both male and female respondents, indicating similar challenges faced by both genders in the labour market.

By duration of unemployment among the actively unemployed, 53.2% were unemployed for less than six months, while 46.8% were unemployed for six months or more. Approximately 26.6% of unemployed persons have been without work, actively seeking employment and available for work for more than one year during the reference period. This group is classified as long-term unemployed (Figure 7b).
